>cracking down on some 10M rigs that in their words are "blatantly & primarily
>designed for bootleg CB operation".......Hope that answered a little of your
>question!!!!
>
>

Yeah, what he said!

I just didn't feel like typing it that night. but one thing I will
add. the original President Exports, (this was BEFORE the SS-JA days)
were really built by the president people, and when they found out
about the clones, they got majorly P.O'ed and moved to europe. Touchy
people they are.

I'd like to find a mint condition President Jackson from this era...
my uncle had one, it rocked! someone stole it though..

73's to all

P.S. anyone in here going for thier general before the deadline? I'm getting my written. just about done studying.....

Yeppers.
I don't know about the 212, but the 242 has two little blue jumbers
(marked 000) on them.
if you snip the one closest to the VFO knob, it'll open it from 136 to
174 fer ya.

Dewight,
I asked my LT about this today. We already have laws on the books we could use to stop this type of problem. He said we might need to be a little creative but it would fix such a problem.

Dewight your a technician Class (VHF UHF and 6 meters) You have been a ham since 8-99 how could you know what I do or don't have a license to do. Your useing a Vanity call of w5net and your really a KF call. was it worth the $50 bucks? Seems to me that your tring to pull the wool over some poeples eyes. Maybe it was you dads call. By the way how is the weather out there in Bremerton Washington Dewight! My advise to you is to speek on what you know.

RE my E.F. Johnson Ranger and Valiant listen to 3.850 sometime.

I will also say my Duty HT is a Moded yeasu ft50rd. Although it is not type-accepted for Police band the Southern link (like nextel) 2way system is not ither. Type-accepted radios is just another way of ripping people off. I am going to charge you $350 for this none type-accepted yeasu ft50rd and $850 for the Vertec version. Same guts same radio differnt case.

Some people Fish, Hunt, what ever I like Big old am Transmitters.

73,
Bean

They don't have to prove that you used an amplifier. They have to prove that you were in possession of an amplifier. You are innocent of possession until you are proven guilty of possession.

Ok Big Dog

I would make sure everything is grounded really well! Add another groung strap to radio put it on the coax nut with ring or nut on back of radio! also some real world lessons sometimes you might not have enough groud plane with that antenna. Yes it might show a good Swr On the bumper but BUT BUT sometimes if you don't have enough ground and grounplane surface like (roof solid connection 102)your system will starve for ground you can get a hot mic squeal or even bit(shock).

Hope this helps check it out. On your next post need more info like your coplete setup.

Good luck

Tim

19. Newbie question - is CB the right solution?

Newsgroup: rec.radio.cb
Date: 2000-04-01 00:00:00 UTC
From: Larry Diehl <ldiehl@iname.com>
Message-ID: <XMeF4.26545$lg.116221@news1.rdc1.tx.home.com>
Source record: 29469

Sorry if this sort of thing has been asked a dozen times before, but after searching the group I couldn't find anything that really answered my question...

I'm sick of paying for my cellphone month after month just so my wife can call me once in a blue moon as I drive home from work. So, I'm looking for some other solution. I work about 20 miles from home in a 'city' area (north side of Fort Worth). Is there a legal, reasonable cost, CB solution that will allow us to communicate over this range? If not, does anyone have any other, serious, suggestions?

Thanks

HI

I suggest getting a CB radio with SSB [Single Side Band] capabilities. The FCC permits 12 watts PEP in SSB mode rather than the 5 watt max in am mode. Also because of the way that SSB works + the increased power, the ranger is further than a simple am CB.

Having SSB allows you more channels because you have 40 am channel, 40 USB channel, 40 LSB channels. Also, SSB CB operators, I find tend to be more respectful and coureous

Also CB is great because it has emergency frequency channel 09 and traveler assistance channel 19.

Bean, I've never been shy about my license class (no need to, anybody can check with the FCC site to find out about me). In fact, I used to have a signature that included my license class, and my web site, but some people objected to the mention of ham radio in this newsgroup, so now I keep a lower profile. By the way, if you'd like to know more about me, feel free to check out my web site at....

http://www.qsl.net/w5net/

Another sourse of information about me can be found at...

http://www.silverlink.net/aux/division/

Actually, I'm not in Washington anymore. I just moved east about two weeks ago. I'll be sending in a change-of-address to the FCC shortly (and updating my web site).

I decided to use a vanaty call because it was easier than my issued callsign. Since the FCC was out of the "k" prefix Group C Technician/General callsigns (one-by-three format), they issued me a novice callsign (2x3). Shortly after that, they opened up the vanaty callsign system to all license classes, and I decided to get a proper 1x3 callsign. The letters were picked simply because they are easy to remember. And, yes, it was worth the $50.

Well, take care, Bean.

Regards,

Dwight Stewart (W5NET)

And, would you show me one place in this discussion where I have said that I agree with this law, fool. I've commented on the various aspects of this law, but I have not stated once whether I agree or disagree with the proposed law itself.

People like you who, without cause, paint people as the enemy, based solely on your own presumptions, are the real threat to this country. Innocent people throughout history have been lynched by people like you.

Please, PLEASE, make sure you have your facts straight before you go after someone in the future. Better yet, stop painting people as the enemy just because they have different opinions. I'm sure that all of us, who desire a country where all opinions are freely expressed, would sincerely appreciate that.

That sounds like fun. A bunch of guys driving vans that have two of those coily antennas on the roof and more watts than anyone could ever possibly need, repeating over and over "1, 1,1, 1,1, 1" or "2, 2, 2, 2, 2.." and bleeding on every CB channel there is within a 2 mile radius.

Gee. Wish I could have been there, or better yet, wish I saw the address so I could have notified the local FCC office..

It's obvious that you are purposely straddling the line of no
commitment. But it is also obvious that by the jist of your posts on
this subject you are defending the logic of this type of legislation.

Larry,
Depends on what you call 'relaible'. And the short answer is stick with the cell phone and change your 'plan' with the cell company. It may, or may not be available with your company, but the one here has a plan where you are only charged for actual use. No discounts, etc., straight $ for minutes. As long as you don't use the cell phone, theres only a minimum fee($3.??/ month here). Thats your best bet.
CB is very unreliable over the distances your talking about. 2 meter is better, but do you wanna take the test? More importantly, would your wife??
'Doc

I hate to be rude but, SSB does NOT give you an extra 80 channels. You are still on the same channel irrespective of which mode you are using, be it AM, LSB, USB or even FM. All modes will interfere with each other (when on the same channel), although I do concede that you can operate on USB whilst another person uses LSB - as long as they are not to close in terms of distance.

Dwight Stewart <stewartx@sccoast.net> wrote:
:>
:> Therefore, without specific EVIDENCE such as FCC monitored field strength
:> reports IN ADDITION to simply posessing, there is no grounds for discipline.

: It does not require a field strength meter test, and an audio expert
: to operate it, to enforce laws concerning sterios that are too loud.
: The simple fact the a complaint is made, the police officer hears the
: noise, and he uses his ears to discover that the noise is coming from
: your home, is enough evidence to enforce these laws.

Correct. But audio noise is NOT regulated by the FCC. It is covered quite
legally by local noise ordinances.

: The same would likely be true for the radio. The fact that a
: complaint is made, the officer confirms the complaint (hears the
: interference himself, for example), sees an antenna on your house next
: door, discovers that you have a radio (linear, etc.), and that the noise
: stops when you stop transmitting, would probably be enough evidence in
: most cases.

Wrong.

: In other words, the fact that you are causing unusual interference
: with your neighbor's electronics would probably be enough to enter your
: premises. The addition of a linear found on premises would be further evidence.

Again, wrong. Read the warnings on all consumer products that they must
accept any interference that occurs.

Just because your station causes interference on a neighbor's electonics is
NOT evidence of an illegal station. Nor does the local officer have the
legal standing to enforce federal laws.

I have a couple of different 8 device amp's both of which use a single bias supply.

However, I believe the early Messenger amp's went for individual bias adjustment for each pair of devices. Is it not beneficial to be able to have control over each pair for the reason that we have discussed before, that of running a higher bias voltage.

You previously guided me in the direction of 'leading edge technology' if you remember.

I am at this time laying out a circuit for a 16 device broadband amp orientated for good IMD and using a stock HF transceiver for drive. I hope to see a relatively clean 1500w peak with a suitably stiff mobile PSU.

Anyhow, once again thanks for your insight.

> 70s, before the big CB craze.

Okay, I certainly don't want to get into this bullcrap discussion again (next, someone will be saying that I said CB didn't exist).

Anyway, read the original message again, Bill. The issue (then and now) is not whether skip exists, but whether a person can contact more than half the countries in the world using a simple CB radio (by the way, that is nearly 200 countries). I say it is utterly impossible for several very simple reasons.

1. Most of the countries in this world do not fall within a normal skip zone of 11 meters in the US (Australia does). It would be nearly impossible to contact Mongolia, for example, because it is not in a normal skip zone. The same for much of the far east, middle east, north-eastern europe, and eastern africa (that kills more than half the countries right there).

2. What little skip that might make it into the United States from those regions would be so weak that it would easily be lost in the background noise (even on the typical freeband frequencies).

3. There are very few radio operators (much less freeband operators) in those regions. The chance of one being on the air when a the conditions were right, and a person being on the same frequency here in the US, is highly unlikely.

4. Even if all of the above were not true, the chance of pulling in a station that weak using a simple mobile (without a major antenna array, noise filtration, etc.) would be nearly impossible.

Now, note that I didn't say that skip doesn't exist, only that it is impossible to contact half the countries in the world using a simple mobile radio. So, please don't start telling me about the rare contacts you made with this or that country (and please don't start sending me qsl cards like one guy did). I don't care if you made a lucky contact with someone in one or two of those regions. That is not the issue.

I'll put it another way, Bill. Have you cantacted half the countries in the entire world? You've been in radio since the early 70's. Because of that, it should have been easy for you. After all, he did it using nothing more than a simple mobile radio.

Also note that I did not say that contact with these regions is impossible (ham operators do it all the time using large antenna arrays). God, with all these disclaimer, I feel like a lawyer.

Anyway, that is all I have to say about this nonsense.

all low pass filters are about the same in as much as they are
just an LC network filter....the difference is in how heavy duty
the parts are and how much power they will hold.

65. FS: Limited Space/Stealth CB Base Antenna $37.95

Newsgroup: rec.radio.cb
Date: 2000-04-01 00:00:00 UTC
From: AntennaWareHouse <kingpop@cis.net>
Message-ID: <38E61CE2.E5ECE593@cis.net>
Source record: 29515

Hello,

I have a new antenna for limited space/stealth applications up on a eBay Dutch auction. They are full size 1/4 wavelength antennas with a tunable loaded counterpoise, so their performance is very good. They are furnished with a versatile mounting bracket that allows for many different mounting situation. Such as fastening to a stick of wood that could be stuck out the window at night.

The Auction ends 4/2 9:47 pm cst.

You can see them at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=297138241

This is a Dutch auction, which means no worries about being outbid at the last moment, or the price sky rocketing because of bidding wars. You bid you get one!

Be sure to check our other auctions and website for other great deals on Amateur, CB, and scanner antennas.

Thank you

: Constitutional feelgood fuzzies be damned, the glitch in the system is
: that an accused private individual does not have equal access to the
: legal expertise behind his defense as does the gummint in it's
: prosecution. It strikes me that an accused perp who makes $30k/annum
: and has to pop $10k in legal expenses in his effort to keep his butt
: out of a sling is coming from 'way behind in a brawl against an
: accuser whose budget next year will be $1.8 Trillion. Give or take.

The only way that the Feds can afford to go after someone is to
take only a few cases. If the Federal courts get as loaded as the
state courts are, it is very easy to slip thru.

My suggestion is to buy into a Pre-paid legal service. Think
of it as legal insurance. About $25 per month.

: >
: But then I guess we should be thankful that we don't live in Singapore
: where you get banged for $2,500 for failing to flush a public John

: the swat team accidentally chose the wrong address. Unannounced,
: someone broke down his front door. He reached for his shotgun
: to defend his family from the unidentified intruder and was mowed
: down in a hail of bullets. The police said, Oops, sorry, wrong address.

You sound like a bleeding heart liberal with a touchy, feely
story to whip up emotions. Yes the cops do make mistakes.
And the family sues for a shit load of money, more than that
man could have made in a lifetime.

We are dealing with the results of liberalism (over a 30 year
period). Society is over reacting nowadays. We used to give
people a break, a second chance. But the extreme edges of
society have pushed the limits so hard that people are reacting
by being hardnosed. In a few years it will come down. We
just need to rein in the extremists.

I must correct you again, Stewart. Worldwide skip is almost the norm around here on barefoot, legal radios. 38 lsb has given us over 30 some countries since the new year. I note you began your post implying that it is near impossible to do so on a barefoot, legal radio. You then interject the word "mobile radio" later in your post. This was a retreat. To state that one could never do MOST countries on a legal cb, then interject the word "mobile" at your convenience, effectively nullifies the original debate. Apples and oranges. FYI, the contacts I make from my barefoot 4x4 to the UK and Ireland and Australia are NOT rare. Many folks engage and participate in making these contacts on a regular basis from their mobiles. If you spent more time on your radio and less here antagonizing folks, you just MIGHT get a clue. But I doubt it.

One of the "common" methods of tracking a ground signal from a
satellite is to observe the signal from a satellite tasked in a polar
orbit. These craft are in an orbit that brings them around the
earth several (many) times a day. There are also several birds
up there. Any single satellite can get "line fix" on a station by
using the signal and the point the dopler shift "transitions".
The station would be on one side or the other of the sat along the
line. A second pass or a different bird would give a different line.
Where the lines cross - "X marks the spot".

But - does the FCC have a hook into such assets in orbit?
Probably not.

Best regards
Gil Jones

Actually, I'm a Libertarian trying to get people to use their
thought processes and wake up before it's too late. When you
can just shrug off a homicide committed by the police against
an absolutely innocent citizen, it may be too late to save the
country from becoming a fascist police state. Next time it may
be you or me.

Heres the modification for the new version of the radio. Take off the bottom cover and locate the small elevated circuit board near the front of the radio. Locate Con-1 on his board and short out 2 of the 3 holes with a solder bridge. You will have 400 channels in 10 bands. The 11 meter band is band E, though the E will not show in the display as it does for the other 9 bands, this is normal, and was designed into the radio to keep the FCC happy, or slightly less angry. The blank center top button is your band select. This mod is the correct mod, and it works perfect. Make sure you get the right holes when you do the mod...its not that hard, you are basicly shorting out holes instead of shorting out jumper pins. No biggie. If you need more help...let me know. So Long.

do you think anyone cares what you write here, slick?,, no , no one
cares about this or that do they , you know why, this is cb radio isn't
it? the land of strange, if you take yourself too seriously then you
are a merely a figment of your own imagination, and all that bs about
using the dejanews service to hide behind, i do not know what the heck
you are talking about good buddy, but i do have a great idea, why don't
you go down to the service station, in the big town and buy yourself a
coke on me and twiddle your thumbs, speaking of relevancy, all you ever
talk about is your silly little desert spot , abbreviated , i believe ,
hell hole, for short. so don't worry about cd , go get a life, cause i
am here to stay, i am a card carrying member of the cb radio fan club,
and dat's da truth. oh by the way jay bob, my radio is bigger than your
radio and so is my dick, cd is out.....

But you use the emotional twisting style. Cops make mistakes,
mistakes that are costly. But they are not just running out killing
people at will. And we are still a long way towards becoming a
police state. All that is happening is that we are returning to the
more conservative values we used to have. Unfortunately those
individuals on the edges of society are pushing limits. These individuals
must be reeled in and brought under control. Thus we send more
to prison where we used to use other means of discipline. For
one thing, those on the edges of society have abused the rest
of us, especially when we give them another chance.
```

2 meter ham radio is the way to go,and if your wife is like most and
hates static and foul language then so much more reason.Tell me what
city/cities you are near and I'll send a repeater list.

Actually you still have only 40 channels,just 2 modes instead of 1.

Also, SSB CB operators, I find tend to be more

> bean

I'm finished traveling for a while. I'm ready to settle down somewhere (a place where I can have a big dog and a big antenna setup). The Seattle area was not that place (too cold and too wet).

Oh, I love the FT-847. I've owned a lot of radios over the years, both CB's and ham radios during the short time I've been a ham. This radio does it all and more. Of course, at the price, I'd better like it (I can't afford to replace it).

After the last trip to Italy, I got some money because of a minor job injury. I put most of that money into radio and computer equipment. And a little went into a down payment on the new truck (Ford Explorer). And the rest I'm spending a little at a time on "stuff" (stuff - little things that you probably don't need, yet eat up money fast).

I figured that while I had the money, I should spend it on that one radio I could never afford to buy otherwise. After a lot of shopping, and talking to other operators, I decided on the 847. It was well worth it. I plan to keep it until it simply will not run anymore.

My dad was ham operator, but I simply cannot remember his callsign. I grew up listening to him on the radio using that callsign, but that was a long time ago (he died about twenty year ago in a auto accident).

Well, on my way to the hardware store to buy a couple of antenna poles. Take care. Catch you around the newsgroup.

Dwight

The mobile radio can in because that is what he had claimed to use. I
didn't add it in the first place simply because it was a minor detail to
include in an quick overview of a past conversation.

Actually, it does not make any difference. Even with a base station
(or a mobile in a base station arrangement), my original statement still
stands. See my explination in another message for the reasons why I
think that.

> If you spent more time on your radio
> and less here antagonizing folks, you

I didn't know that disagreeing with a person's opinions was
"antagonizing folks." I'm sorry. From now on, I'll take a poll first,
and then only post messages that agree with the majority. <yea, right>

Source record: 29549

I wanted to put a cheap CB set-up in my garage so I used a Mobile radio and an old mobile antenna. I ran a ground wire from the antenna to a metal stake that I drove into the ground. If I disconnect the ground wire, turn on the radio and set the squelch so that no static can be heard then reconnect the wire the incoming signal breaks the squelch and the radio recieves stronger. However, the SWR does not change, it is about 3:1 regardless of whether or not the ground wire is hooked up. With an antenna matcher I can get the SWR down to 1.5:1 but I want to do it the right way. Anyone have an idea what the problem is?

Of course they are, just like they did during prohibition. We
never learn. Adults using drugs in the privacy of their own
homes have a perfect right to do so and a large percentage of
the population do just that. Many entertainers and even
politicians smirk and admit doing such when they were young,
but not presently (yeah, right). The war on drugs is a
ploy by the government to take away the individual rights
of the citizens and it is working.

I use drugs every day - caffine to wake me up, St. John's Wort
to stabilize my moods, and scotch to calm me down. Marijuana would
be a lot better for my health than scotch but it seems the government
would rather I have liver problems than smoke a God-given weed.

Pontiac,
This formula isn't 'set in concrete' by any means
but will give you an idea of what the 'bare' minimum
current requirement is.
Ir = (I = P/V)/50%
where;
Ir = current required
I = current
P = power output
V = voltage

This will give you a 'ball-park' figure. It's the
'normal' current formula divided by the efficiency of
the radio. Efficiency isn't standardized, but for a
transistor radio 50% is about average.
This is the minimum current required. Add in a safety
factor of at least 50%. For your radio about 11 amps.
One thing to remember is that too many amps can't hurt
you, too little amps WILL cause problems. Think big!
'Doc

Source record: 29556

Pontiac,
Grounding has nothing to do with the SWR of your
antenna system. It does have a lot to do with safety.
Keep the ground connected.
With a 3:1 SWR I'd say you need to tune/retune your
antenna. Not knowing what your antenna is, I've no
way to tell you how to tune the antenna, but you probably
know anyway. Tune for minimum SWR (doesn't matter what
it is, just minimum). If it isn't 1.5 to 1, or less,
you might be able to 'fool' the radio into thinking
it is by adding about 3 feet of coax to the feed line.
This does NOT change the SWR, it just plays 'mind-games'
with the radio.
'Doc

Pontiac,
Oops! Forgot about the tuner. Doesn't hurt a thing
if you want to just use the tuner and forget about tuning
the antenna. About what's happening if you add the 3' of
coax...'mind-games' that 'fool' the radio into 'seeing'
an SWR that it likes.

Hate to burst your bubble, but I don't have a filter in my web
browser. Certainly I could spend some money for a new one or download it
from Netscape, but the last three times I've done things like that, I've
had nothing but problems. Could be Windows 95, could be the other
software, in either case, the computer works fine at the moment and I'm
not going to rock the boat! HAHAHA!
I think the point of this argument is do we respect the Charter or
not. Does it mean anything or is it to be discarded as being worthless?
I can't speak for everyone, but my parents raised me to repect the
wishes of others. If this newsgroup or any other one was established to
be a discussion group and not for the auctioning or selling of
equipment, then why is it so hard to respect that and go to a newsgroup
that has been set up for that purpose?
Some may answer that by saying "I'm not hurting anyone" or "Use a
filter". Seems logical, however we didn't establish this group, we are
enjoying its service for free and some respect would be in order. I'm
amazed that nobody in "authority" has said anything. Is there someone
overseeing this group that "manages" this that can shed some light on
this subject?

I surely do agree, This could have been done right with capacitance added or subtracted on either side of the relay as it was switched, but as you said, it is not worth it, I personally would have done it in AB and left it at that.

I believe it to be best if you bias all sections on one circuit, especially good if you do it with a regulator and a pass transistor to carry the current. trying to bias each section individually is more trouble than it is worth, if one section of the bias fails it can cause havoc or an imbalance.

Exactly. If I am willing to commit murder and break a law that has the possible penalty of life in prison or death, why would I not also be willing to break 100 laws that lead up to that.

"I was going to shoot the MF in the head but he was on private property so I couldn't get near him."
"I was gonna rob the bank but I didn't have change for the parking meter and couldn't park out front."
"I was going to mow down a crowd of people at the mall with gunfire but I only had hi capacity mags. and my firearm wasn't registered so I couldn't do it."

If violent criminals are released back into the population they have only been delayed from their violent crimes. Not stopped
Sorry a little ot but I had to say it and here seemed like as good a place as any.

Yeah I gotta agree. Astron makes the best supplies and they are the ones most Hams use. I have a 20A and a 35A that I have used for over 5 years with no trouble. I have a link to them on my site.

: In the case of guns, a good start would be to enforce the
: laws we already have and keep the armed criminals in jail.

No disagreement here. In fact if you lose your gun rights (felon, mental illness, misdemeanor domestic battery, what ever else they bring up....) should also result in the lost of voting rights, the right to be a professional (teacher, lawyer, CPA, doctor, etc) or work for the government. In other words if you can not be trusted with gun then you should not be trusted in any other area. That would put a real hurt on the democrats plans (creeping restrictions on gun ownership would then hurt them at the polls).

chuckie, i am going for my general in june at the dallas hamfest. i was
wondering , 'would you be my elmer'. that dastardly old stick in the
mud, hillybilly, will not help me, a future ham, get what he hasn't got
and never will get. personally , chuckie, you have always impressed me
with your radio knowledge and i guess that is why i am asking. i know
that you are the kind of person that studies and lives this stuff, so
that is cool with me, unlike hillybilly ,who bought his techie license
from a couple of general class good buddies up thar in them hills that
sold it to him a while back for $300.00. so think about it chuckie, you
have always been my hero, ever since i hit this ng, this is cd and i
am back quiet......

Sent via Deja.com http://www.deja.com/

>on the spot to get that money , no matter where it comes from

You might have a point if you were speaking of an individual. Which is not the case. Folks in this NG come and go. They all are unique. There is not a solitary profile of a CBer. You'd resent it if folks thought and behaved as if there were. So don't be so quick to stuff other groups/races/etc into a convenient slot.

: > But you use the emotional twisting style. Cops make mistakes,
: > mistakes that are costly. But they are not just running out killing
: > people at will.
:
: Of course they are, just like they did during prohibition. We
: never learn. Adults using drugs in the privacy of their own
: homes have a perfect right to do so and a large percentage of
: the population do just that. Many entertainers and even
: politicians smirk and admit doing such when they were young,
: but not presently (yeah, right). The war on drugs is a
: ploy by the government to take away the individual rights
: of the citizens and it is working.

That is a bit paranoid. At it height, illegal drug usage
only effected 14% of the population and that was in
the late '70s. Now it is only 6% of all Americans.

Why we are seeing a contraction of civil liberties is that
we increased those liberties in the '70s. Now the same
liberals who pushed those rights are rethinking their positions.

Do you remember how much power J Edger Hoover had?
Then those powers were removed by congress when he
died. Our government does not have as much power as
J Edger had.

: I use drugs every day - caffine to wake me up, St. John's Wort
: to stabilize my moods, and scotch to calm me down. Marijuana would
: be a lot better for my health than scotch but it seems the government
: would rather I have liver problems than smoke a God-given weed.

In proper usage, pot might be as useful as St. John's Wort. However
since we are now so urbanized (the rural population is highly urbanized
as well), there isn't a lot of good sense out there. I would not trust a
lot of suburban apartment dwellers with even a kerosene heater!! Let
alone a gun.

We really need to return to the military draft so that we can
teach these idiots what any farm boy grew up knowing.

Speaking purely as a historian, BULLSHIT!!!

Hitler's regime was oppressive towards the average German. Anyone who stepped out of line risked a trip to the People's Courts and a one way ticket to the guillotine.

I have suggested to the person in charge at the host of the "rec.radio" hierarchy (University of Hawaii) that any message starting with "FA:", "FS:", or "WTB:" not posted on "rec.radio.swap" have its distribution rewritten to appear on the swap NG and not on the others. However, the problem is that as soon as spammers notice this, they'll continue and simply avoid the catch phrases that cause the rewrite. There's no easy solution other than to MODERATE EVERY POST, and that step hasn't become necessary yet.

[Similar result if they notice that their posts are being filtered out.]

Wow. Let's see...disarmament. Restrictions on communications.
Poor folks being told to shut up by their 'betters'.

Am I the only one who finds this eerily familiar?

No it isn't, although Sirio does make a similar model. The upper elements of these are made of heavy gauge, ribbed aluminum tube. Not the shower curtain rod stuff that Sirio is famous for. These are made by CTE International, a sister company of Midland Corp.

As time goes on new aspects of the G0CWT Loop come to light. The latest was when RF became noticed on the feeder from loop to rig. When I finally solved the problem it also cleared up another mysterious problem that sometimes caused a properly tuned loop to have a poor SWR when connected to the rig but a 1 to 1 SWR when measured with the MFJ 259 SWR Analyser. Details can be found by going to http://members.aol.com/benprom and then click on New Info
there are also the latest details of a 160 metre thin wire Loop that also works as a full wave loop on 40 metres and covers other bands up to 10 metres.

Thanks for your interest feedback would be welcome, but not the RF type.
Cheers and 73 from Ben G0CWT in England

Dwight Stewart <stewartx@sccoast.net> wrote:

: Anyway, read the original message again, Bill. The issue (then and
: now) is not whether skip exists, but whether a person can contact more
: than half the countries in the world using a simple CB radio (by the
: way, that is nearly 200 countries). I say it is utterly impossible for
: several very simple reasons.

: 1. Most of the countries in this world do not fall within a normal
: skip zone of 11 meters in the US (Australia does). It would be nearly
: impossible to contact Mongolia, for example, because it is not in a
: normal skip zone. The same for much of the far east, middle east,
: north-eastern europe, and eastern africa (that kills more than half the
: countries right there).

Maybe not common skip zones - but they vary in length, depending on the exact height and reflectivity of the ionosphere. It also depends on where in the US a person is located. What may not occur from one area might work fine a couple of hundred miles East or West of that area.

: 2. What little skip that might make it into the United States from
: those regions would be so weak that it would easily be lost in the
: background noise (even on the typical freeband frequencies).

Maybe.

: 3. There are very few radio operators (much less freeband operators)
: in those regions. The chance of one being on the air when a the
: conditions were right, and a person being on the same frequency here in
: the US, is highly unlikely.

This is the most likely limiter.

: 4. Even if all of the above were not true, the chance of pulling in a
: station that weak using a simple mobile (without a major antenna array,
: noise filtration, etc.) would be nearly impossible.

You are the person claiming that the signal is weak. The signal strength in a mobile is only about 7 or 8 dB down from a tribander - although you have to contend with more signals from unwanted directions in a mobile.

: Now, note that I didn't say that skip doesn't exist, only that it is
: impossible to contact half the countries in the world using a simple
: mobile radio. So, please don't start telling me about the rare contacts
: you made with this or that country (and please don't start sending me
: qsl cards like one guy did). I don't care if you made a lucky contact
: with someone in one or two of those regions. That is not the issue.

The Australian, New Zealand etc contacts were not "rare". They were
rather common. Of course, I am in a good part of the US for such
contacts, living on the West Coast.

: I'll put it another way, Bill. Have you cantacted half the countries
: in the entire world? You've been in radio since the early 70's.

Not on 11 meters, but I never was very serious about DX. I never tried
to contact weak stations - assuming that they were base stations, and would
not hear my mobile.

I have been in radio since the mid 50s.

: Because of that, it should have been easy for you. After all, he did it
: using nothing more than a simple mobile radio.

I never said it was easy. It would take some very dedicated effort over
a rather long time span - during a good sunspot cycle. I am far too lazy
to spend the effort in the attempt.

: Also note that I did not say that contact with these regions is
: impossible (ham operators do it all the time using large antenna
: arrays). God, with all these disclaimer, I feel like a lawyer.

If it can be done with large antenna arrays, it can be done with a
mobile antenna. Not nearly as often, or as easily, but it can be done.

Hello PEAK,
>I believe it to be best if you bias all sections on one circuit, especially
>good if you do it with a regulator and a pass transistor to carry the
>current. trying to bias each section individually is more trouble than it is
>worth, if one section of the bias fails it can cause havoc or an imbalance.
I disagree. The 2879 data sheet specifies a min Icq of 100ma per device
for class-AB operation. In my Skywalker 8-pill amp the designer states
that by increasing Icq up to 750ma per device results in increased
linearity and lower IMD and harmonics. He quotes 'Many customers have
asked why our amps sound better than the factory amps'. The higher Icq
is the reason. Why don't other amp factories increase Icq? Because it
costs more $ build a separate high current bias source for each pair or
module and even more to produce an amp that will remain stable with a
high Icq. So the factories use the minimum recommended Icq because it is
cheaper and it yields satisfactory results.

I think Bill E will agree here as he is a proponent of this theory.

Phil / UK

>better parts as it all went bad.Think all that isleft origional on mine is
>the
>case and switches.

I agree that the larger Pyramid supplies that usually endure more frequent heavy loads have a more frequent failure rate than some, but I have yet to have a smaller supply (15a or less) fail out of 30 or so I have used.

once in a while a tool box will work ok. but most of the time
they are a lousy place to mount an antenna. the biggest
problem being that they don't ground good to the body or they
are not made of a good conductive material....quite often what
looks like a good ground and checks good on an ohm meter is not
a good AC ground for 27 mhz....just because it lights a bulb
doesn't mean it will work for RF....

I have an older Galaxy Saturn Base (5 band unit) that I want to
get rid of (too many radio's in the collection). I'd like to get
$200 or $250 with turner mic, or swap

some of the things I'm looking for
MFJ-418 morse tutor+ $100
an adjustable 50 amp power supply (the pyramid would be just
fine)
or lets chat and see what you have that I may be interested in

Agree..... I have an antenna, my neighbor next door
has an antenna, my neighbor behind me has an antenna,
finally my neighbor directly across the street,one street
over has an antenna. Which one of us is causing interference?
A matter of fact, in a one block radius I have counted
7 antenna's. So which one is causing the interference?

Obviously you didn't here how the supreme court
just ruled that an anonymous call is not sufficient
evidence for search. A warrant must be obtained.

Even the most casual of users experience life changing problems. Self-esteem, depression, lack ok motivation, clear thinking. Minor changes that grow over time into things like, lack of morals, wife ond or child abuse, slow but sure self destruction.

I am one who believes a law should be passed to out law all new laws. Congress should spend its time trying to rid us of the endless supply of needless laws, regulation, and restrictions.
But when it comes to drugs! I know what we are doing now is not working. But I also know makeing them legal will only make things worst.

:
: Speaking purely as a historian, BULLSHIT!!!
:
: Hitler's regime was oppressive towards the average German. Anyone who
: stepped out of line risked a trip to the People's Courts and a one way
: ticket to the guillotine.

One of the big questions was why so many Germans supported
Hitler. In truth, Hitler was a step from what they had experienced
under the socialists. Germany, even today, is a society that is very
homogenous. The little old ladies in every neighborhood keep a
sharp eye out for anyone who violates the norms. It is one reason
that Germany has fewer cops than here. They have a huge force
of old ladies.
```

I have a Silver Eagle forsale. Excellent Condition!!! It's real LOUD!!!!!! I hate to let it go. Has a 5-pin plug for a Uniden Washington. Just put a 9volt battery in it and blow'em away!!!!! If you get this mic, you will not want another mic! This mic is awesome!!!!! Everyone that I talk to here in Georgia is always jealous of how loud i am. Wish i could keep it. Email for pic or any
questions.

$70 bucks

I don't understand all the hype about "SPAM." To me its kinda like junk mail, if it doesn't interest me just toss it in the trash. I guess theirs people that just allow little things in life to entertain there minds to the point were it consumes them. You would think they would focus on the finer things in life.

You all are missing the boat--you CAN NOT use a mobile antenna as he described as a BASE antenna. Why? NO ground plane. Put it on a big piece of metal (car) and then you can match it. Without it, DO NOT even try. You will ruin the antenna.
Dave

Not quite. You still need to tune the antenna for maximum radiated power with a field strength meter. That may, or may not, be at minimum VSWR. An antenna radiates best when it is resonant.

well if you are talking to me, i will tell you this, i only beat my
wife when she request it and those 'beatings' if you will are nothing

more than me putting her across my lap and giving her some well deserved slaps on her beautiful butt , and after that the cuffs go on. as far as the dog is concerned well , i am afraid kicking her would not be a good idea, she is in charge of security at the curious d domicile. considering she weighs about 150 pounds soaking wet, i am of the opinion that my foot belongs were it is located now, on the end of my leg. and as far as me going around complaining all the time, well the only time i complain is when a politician opens his mouth and starts talking , then old curious will start complaining about the royal ass fucking i am getting courtesy of that damn thing we call a government. so there , i hope that clears up a few very important details, this is cd and i am back in the bush.....

well i think it would stack up against anything i have seen out here
and elsewhere. i have to take my hat off to stickman at noname. i am
not going to ever put them down again. i think he definitely knows what
he is doing and i think that 32 pill box they had pictures of on this
ng, a while back proves it. it was well made and very functional. and i
have to give credit where credit is do. and if i had a extra $2,600
laying around, i would go for it. that is all i can say. but if you are
referring to keydown stuff, well it is like you all say, it is the
whole system including the antenna or antennas and the setup that comes
into play there. anyway, cd is out..............

My sincerest apologies if I am wrong, Stew, but I was in on that earlier discussion a while back about the DX countries with you and a few others. I don't remember anyone specifically claiming those countries on JUST a mobile, but you may be correct on that aspect. I do know that as of 2:00 AM this morning, Australia came through like gangbusters on lower 38 and many, many operators contacted that country barefoot with signals of 4x5 and even stronger. You are correct that many of the mid-eastern countries are difficult to reach, but not near impossible. Check out the AT dx reports for contacts made recently. Since October, many eastern and mid-eastern countries are listed along with past, present and predicted future dx reports. Some of them surprised me. Who would think that Iran, Syria, Pakistan, and Iraq would be dxing with the states given the possible penalties in some of those countries for exercising free will? But it is happening. Don't know if it's being done barefoot, but it wouldn't surprise me. I have reached eastern Russia and the Ukraine barefoot on sideband, on more than one occasion, and directly south of that lies some mid-eastern countries, including Turkey and east Africa. Last night was exceptional dxing. I was on our local AM channel at 2 this AM when Australia banged on through. Couldn't get back to them on AM, but flipped the dial to lower 38 and they were all over the place for the easy pickins'. Triple 5 was yielding similar results. Nothing surprises me at this point in the sunspot activity stage.

Yeah, what he said!

I just didn't feel like typing it that night. but one thing I will add. the original President Exports, (this was BEFORE the SS-JA days) were really built by the president people, and when they found out about the clones, they got majorly P.O'ed and moved to europe. Touchy people they are.

I'd like to find a mint condition President Jackson from this era... my uncle had one, it rocked! someone stole it though..

73's to all

P.S. anyone in here going for thier general before the deadline? I'm getting my written. just about done studying.......

Honestly, how can you tell what it will do by looking at the amp in a
picture? The pic is not close enough to see the configuration, all I can
tell is it looks like it uses 1" output transformers and I cannot even tell
for sure, looks does not mean it will talk.

So, what's your point? Do you agree or not? If
not--why?

> However, I believe the early Messenger amp's went for individual bias
> adjustment for each pair of devices.

That was another of their "rookie" mistakes.

The Blue Face 450s (a great, straight 4-pill amp)
uses an elaborate, regulated, filtered bias supply
for each pair of transistors. I like the design
but I can see the overkill in it. The 450s are
expensive because the manufacturer spared no
expense. The 450s are the "Magnum Series" amps.
Magnum Series amps have a reputation for being
decent CB equipment. That means they are strong
and reliable.

It was easy in the old days to end up making bias
supplies for each pair because of the pass transistor
current limitations. In the old days they thought
every transistor needed a half an amp of bias current.
That means you needed a one amp device for every pair
of power transistors. These days we know that 50 mA
of bias current per transistor is enough. In other

words, one big pass transistor is all you need.

> Is it not beneficial to be able to
> have control over each pair for the reason that we have discussed
> before, that of running a higher bias voltage.

That's really not true. If you want to run high bias
you should monitor each and every transistor. The
higher the bias, the easier it is to blow transistors.

> You previously guided me in the direction of 'leading edge technology'
> if you remember.

Yes, but you totally missed the point. I was trying to
lead you toward LESS bias--not more. The state of the
art today is Class B mobile amps--not AB or A (like the
Skywalkers).

> I am at this time laying out a circuit for a 16 device broadband amp
> orientated for good IMD and using a stock HF transceiver for drive. I
> hope to see a relatively clean 1500w peak with a suitably stiff mobile
> PSU.

Make sure you have suitable test equipment so that you
can gather some real data.

I have a good spectrum analyzer for sale if you're
interested. It's good from 100 kHz to 1 GHz and the
price is right (500 US$), but it doesn't have a tracking
generator built in. The book outlines a technique for
finding the center frequency, but it's best if you
already have access to an outboard RF signal generator
that you can use as a tracking generator. At first I
didn't have the money for a fancy spectrum analyzer so
I bought this one (I paid 650 US$ plus shipping) so I
could cut my teeth. Now I'm ready to let someone else
do the same thing. You'll never find a 1 GHz spectrum
analyzer that works perfectly for a lower price. If
you (or anyone else) is interested, e-mail me at:
kd6tas@netzero.net or call me at 650-322-8656. I have
a digital camera and can send you all the pictures you
want. This unit works absolutely perfectly. Again,
the only drawback is that it doesn't have a digital
center frequency readout. If you can live with that,
you can get an unbeatable deal on a tits spectrum
analyzer.

> Anyhow, once again thanks for your insight.

It would be nice if you took my advice rather than
blowing it off like you know more. I admit you've
been around CB longer than I have, but I feel
that you really haven't learned anything. Maybe

it's you're partner that should really be posting
out here. So often it's the "silent" partner that
really knows what's going on. That's not an insult
just a recommendation.

GTE/res03hk3 wrote:
>
> WHAT SHOULD A BRAND NEW FACTORY BUILT AMP WITH 4 1446 PILLS DO?

In the RF Parts catalog 1446s are rated at 70 watts
each. On the other hand, most custom amp builders
expect at least 100 out of them. Some 4 X 1446 amps
are called "500s."

The bottom line is that it depends on the DC voltage
(under load) that you are supplying to it, and how
hard you are driving it. I know that sounds vague,
but it's hard to put an exact number on the output
of an unknown amp. 300 to 500 peak watts (75 to 125
RMS or average watts) would be a good guess.

If you don't understand the difference between RMS
and peak, read the AM Tutorial. The address is
below.

Enjoy.

jonesgil@usa.net writes:
>Then how come ELT signals are located with a mile or
>so usually after two sat passes?

Also, the Transit satellite navigation system gave a position fix
within a few km (I believe) after observing a single pass of a single
satellite.

But then, none of these systems actualy takes "directional fixes" from
the satellite - they observe the change in Doppler shift over time
as the satellite moves along its orbit.

So perhaps Bill is technically correct, in that directional fixes
are not useful for this, but he's commenting on a technique that
simply isn't used.

Dave

Ahh Shit!!! Listen to the CB'ers! They know what they are talking
about!

The ARRL had better investigate a little bit more or add the details
they left out like: Was it stated by the FCC agents that these linears
were gonna be used on 27mhz?

Did the shop point out that these units were for use on 11meters?

By the way, Like the CB Ops stated, It is not illegal to sell,
purchase and possess amplifiers and Export radios, Only to use them!
FCC Had better give the shop there money back!
Who fines the FCC for purchasing this equipment?

Try to get the Sams Photofacts for this rig and follow the allignment
procedures. This will help you better than anyone can explain.
Try the Local Library for the Photofacts and if they have them, get
them copied. Your library should have a copy machine.

If they dont have it for the Adams, Try the Madison. They use the same
main board and allignment procedures are all the same.

Jeffrey is right - when one conducts oneself in a "squeaky
clean~~" manner one doesn't have to constantly recall which
lies and fabrications one was using.....

Since there are several ways using 2 switches, You might need to
borrow a freq counter or you can describe your mod in a little more
detail.

BTW, You would get more channels out of it if you used 1 SPST and 1
SPDT Switch with center off.

If you want the mod that I do on all my rigs and other peoples rigs as
well, e-mail me and I will send it to you. Be sure to remove "no-spam"
to reply.

You havent been out here much, have ya?

Look for a President HR-2510 or a President Lincoln. These are far
better than the 2950's and will last much longer without all the
problems. They may cost a little more but you wont be sorry.

Hook the audio wire back up!
If you did and not getting anything, Get the prints for this rig or
ask someone that has any idea what the color of the wire is for audio
and make sure it is hooked to Pin #2 on the mic connector.

Probably made in Japan 1977, right? Someone made it for Sears. Price?
Depends on before or after the big price drop--I don't know. This unit will
be worth $$$ someday !
Dave

Vincent Charron wrote in message <38E5553C.46ACB876@ottawa.com>...
I recently picked up a new-in-box never opened CB "made" by Sears and
was looking for a bit of background info on the unit. It is a 40ch
mobile model #280.626740, digital display, built in SWR meter and
monaural FM radio. This unit looks great and has never been plugged in.
iIwill eventualy get it up and running but in the meantime could someone
tell me who actually built these units? Was it Sears Electronics ? What
year vintage is this? What was the price back then?.

thanks,
Vince

How do you like that! A Communist (collective) radio station! I know CB is better than them, because it is FREE !!!!
Dave!!!!

altai-es wrote in message <8c1eti$m0i$2@mail.nursat.net>...
What you think of idea of realization of radioexpedition on Southern Altai?

Southern Altai - highland is on the board of Kazakhstan, Russia, China and Mongoly.
Land of lakes and waterfalls, mountain taiga and stormy rivers, deserts and snowy peaks...
In time of Soviet Union this territory had been absolutelly inaccessible for foreign tourists (and furthermore for radioexpedition) - in locale
It is not enough of ham stations.

The base camp of expedition is planned to place in region by highest Fastigiums of Siberia and Altai of a mountain Belooha, lake Markakol and Zaisan.

If you were interested by our proposal, we can be found on ranges 21Mhz, 28Mhz call sign UN8JZZ (collective radio station)

smartass mode *on*

I wish they would just go ahead and legalize drugs for adults. Then the people down the street that run the crack house would not have to fire off guns all night long to ward of the competition, and the savings in ammunition alone would more than allow crack to be sold for 1/10 of the price. The OD's resulting in death would soon bring the situation into a new equilibrium. And since it would be legal and they would not be trying to hide it, it would be alot easier for my neighbor to get a trip to jail for disorderly conduct, DUI, or public intox for smoking weed and crack all damn night with his 'home boys' and raising a rappin' ruckus so people can't sleep. It's all I can do to get him to quiet things down after 10 pm.

smartass mode *off*

I agree with Charles, But have to add a couple things.
CB Radio is part of the HF Bands and is very noisy during the day.
Skip conditions make contact over a few miles really hard. Go with the
Tech License and a 2 meter amateur rig. The antennas for a 2 meter rig
are smaller and plus a nice mobile rig will do 50 watts which is 46
watts more than what a Legal CB will do. Plus, You can even access
auto patches for emergency phone calls over the radio.

Just to show the difference in antenna sizes:
A 1/4 wave CB Antenna is near 106 inches in length as compared to the
2 meter 1/4 wave antenna which is only 19-1/2 inches in length.

For many the simple answer was fear. In Nazi Germany a single critical
remark being over-heard could earn you a one way ticket to Belsen.

> In truth, Hitler was a step from what they had experienced
> under the socialists.

Pardon? Could you rephrase that so it makes some sense?

> Germany, even today, is a society that is very homogenous.

Not really, Germany is changing just like everywhere else. With so many
"gastarbeiter" it is impossible for Germany to remain homogenous.

I ran into the same old lady twice in St. Louis. The first time, I took the Advanced off the street (bit of a license gap due to the Nam) and she decided I was some kind of smartass so she dug out an old yellow Part 4a that was really a short course in CB antenna mythology (hear the same crap on this newsgroup 25 years later) designed to dry gulch those who almost knew what they were talking about. When I took the Extra from her in about 74, the late Norm Fowler N0BJ and I had to fix her Radio Shack key and beeper for the sending test - it had gotten beat up in her travel bag and she was clueless. Needless to say we couldn't have failed the sending test (eliminated shortly thereafter) if we had sent with our elbows. She was indeed a uniquely humorless individual.

: > One of the big questions was why so many Germans supported
: > Hitler.
:
: For many the simple answer was fear. In Nazi Germany a single critical
: remark being over-heard could earn you a one way ticket to Belsen.

And your neighbor would turn you in. Look at the number
of scholars asking why the average German was supportive
of the Nazis? The German public liked Hitler. Hitler even
had a huge support in the intellectual community. For the
most part Hitler, like Clinton, tried to appeal to the establishment
moderates of his society. His propagandists even were
trying to make him out a savior (their were paintings of him
looking like Christ).

: > In truth, Hitler was a step from what they had experienced
: > under the socialists.
:
: Pardon? Could you rephrase that so it makes some sense?
```

The previous administration, before Hitler, was very socialist.
And very restrictive. Hitler was actually considered to be
liberating.

: > Germany, even today, is a society that is very homogenous.
:
: Not really, Germany is changing just like everywhere else. With so many
: "gastarbeiter" it is impossible for Germany to remain homogenous.

Even more so in France and the UK. It is a very big
arguement in Europe.

: > The little old ladies in every neighborhood keep a
: > sharp eye out for anyone who violates the norms. It is one reason
: > that Germany has fewer cops than here. They have a huge force
: > of old ladies.
:
: And you have a huge force of bullshit!

I have lived in Europe, mostly Germany. I have
been there 9 times. I assume that you have lived
there to speak with such authority?

Try washing your car on Sunday. Or not cleaning
your steps on Saturday. You will hear about it. If
you do not comply then they call the cops.

On average, I saw a politezi once a week. I see cops
here daily. When I came back, the US seemed like a
police state compared to Germany.

Lowanse,
Do your self a favor, stay away from the 'sweep-tube' amplifiers! The 6LQ6's are getting very expensive, when you can find them. The larger the number of tubes in an amplifier, the larger the headache. Both of the amplifiers you named are out of production, were never that good (easy to keep running) to start with, and have NOT improved with age.
There are a numebr of 'good' used amplifiers on the market, and if you stick with 'name' brands you should do well with any of them. If they use 811's, 572's, 4-400's, or 3-500's you can still find them easily, and won't have to find them very often.
'Doc

I agree.

> I disagree. The 2879 data sheet specifies a min Icq of 100ma per device
> for class-AB operation. In my Skywalker 8-pill amp the designer states
> that by increasing Icq up to 750ma per device results in increased
> linearity and lower IMD and harmonics.

Phil, you're missing the point. Regardless of what level
of resting current you choose, it's better to use a single
bias supply rather than separate bias supplies. That's the
point PEAK was making--and I agree with it. I'd have to
double check, but from what I remember, the Skywalker amps
use a single, well-regulated bias supply. That's exactly
what PEAK was recommending. I see it the same way. The
bias supply in a high-end amp should be well regulated and
extremely well filtered, but it can be applied to all the
transistors at once regardless of whether there's one or
128 as long as it's capable of supplying enough current
without losing regulation.

> He quotes 'Many customers have
> asked why our amps sound better than the factory amps'. The higher Icq
> is the reason.

Does he really say that the higher resting current is the
only reason? Keep in mind that Skywalker amps use an amount
of negative feedback that is totally unheard of in any other
design. Look at designs for high-end, AB class, push-pull
audio amps. Negative feedback cancels distortion. Biasing
closer to Class A lowers distortion. Given that, it's obvious
that the Skywalker design maximizes the use of both of those
tricks. The Skywalker biasing pushes the amp as close to Class
A as is possible without becoming totally inefficient. Then,
the design incorporates an unusually high amount of negative
feedback both to stabilize the amp because the high bias and

to cancel out as much distortion as possible.

In the end, the Skywalker design is far from "leading edge."
His design works because it uses age-old design tricks. He
was obviously shooting for a bullet-proof, will-work-no-matter-
what design, and he was willing to sacrifice efficiency to
get it. Unless you're looking to sell a kit to hams, you
(Phil) should be looking to copy successful leading edge
designs--not 25 year old, low-efficiency, workhorse designs.

> Why don't other amp factories increase Icq? Because it
> costs more $ build a separate high current bias source for each pair or
> module and even more to produce an amp that will remain stable with a
> high Icq. So the factories use the minimum recommended Icq because it is
> cheaper and it yields satisfactory results.

Or, more likely, that it trully isn't neccessary and
Skywalker (I forget his name) is just trying to tout
his own product.

Never underestimate how far someone will go will sell
the product that is the result of a tremendous amount
of their time.

> I think Bill E will agree here as he is a proponent of this theory.
>
> Phil / UK

I'm a proponent of using B class biasing over AB Class
in CB (not ham) amps that are used in SSB applications.
In AM-only CB applications (especially those where the
amp is run with high collector supply voltages and drive
levels that cause gain compression), I prefer unbiased
(where the transistor bases are at DC ground) designs.

One thing to keep in mind is that we're on a CB newsgroup,
and that even though some people use ham amps in CB
applications (and vice-versa), ham and CB amps are in
many ways different animals. When participating here
I tend to keep the focus on CB applications. In other
words, what CBers want from an amp rather than what hams
expect from an amp. If you (Phil) think about it
(since like me you are both a CBer and a ham), you'll
soon be able to clearly see all the differences.

The Skywalker amps use higher bias, but they require
boatloads of negative feedback to maintain stability.
That results in a noticeable loss of efficiency. If
linearity at the expense of everything else is what
you're after, that may be the way to go. However,
based on my own testing, I feel that the difference
in actual over-the-air sound quality between AB and
B biased amps is unnoticeable. In fact, the nod often

goes to the B amp because it's more stable due to a lower harmonic content. A high harmonic content can add a very noticeable "fuzz" to the audio.

In my opinion, the bottom line is that the ball is in the designer's court. There are many desireable traits that an amp can have that have to be juggled by the designer because it's simply not possible for an amp to do everything perfectly. The obvious example is the easily apparent difference between ham and CB amps. Ham amps are generally cleaner, but they are more expensive, less efficient, and unreliable when used in CB competition. To make it as plain as possible, Power Cubes and Skywalkers won't win CB competitions, and in CB applications they are simply a bad value compared to the specialized CB amps that are available. On the other hand, CB amps won't win any linearity contests (using test equipment) when pitted against ham amps. The only exception might be when a properly biased CB amp is running comfortably and the ham amp is forced to work hard in order to match the output of the CB amp. For example, pit a 4-pill ham amp that's designed to make 500 or 600 maximum PEP watts against a biased 4-pill CB amp that can produce 1000 PEP watts but is only running at 750 PEP watts. Can you see where I'm going? CB amps are seen as "dirty" because they are asked to produce absolute maximum outputs and are fed by dirty source signals. It's basically an apples and oranges comparison that leads to a misguided stereotyping of CB amps. Feed a high-end CB amp with a clean source signal and run it conservatively, and the output will be as clean as any ham amp where the ham amp's output filtering is bypassed. Run the ham amp under high-level CB conditions, and on top of not being able to measure up power wise, the ham amp will either go into self-protection, fail, or be just as "dirty" (if not dirtier) than the CB amp.

There's alot to be said for the current breed of high-end CB amps and the technological advances that spawned them. If I were you (Phil) I'd pattern my 16 pill amp after a #12 (Dennis) biased X-Force. Many people run the #12 biased X-Force base amps and report very few neighborhood complaints. That's an obvious indicator that those are clean amps. I doubt that they contain any output filtering, yet they still produce positive user reports when used in base station applications. What more can you ask for? I doubt there is a more elaborate (or successful) bias circuit design currently available. Combine that with the raw performance of the unbiased X-Force design, and you've optimized about

as many parameters as you're going to be able to optimize
in a single design.

I hope this helps. And thanks for listening to my ranting.

....so does attaching it to the ground not create a ground plane??

Also for quick testing purposes I have a mobile antenna attached to the
metal roof of my garage and it works fine as a "base" station.

Of course, you state only one side of the story. Whatever the truth
regarding that incident, sadly, a VERY small number of anomalies will
occur.

The vast majority of law-abiding, upstanding citizens will never come in
contact with the authorities in a negative manner. For proof, take the
number of such incidents similar to what you've mentioned above, say,
over the last decade, divide that by 148.7 million, multiply by 100, and
toss a percent sign on the end.

Regarding the 5lb maul and DaveMade equivalent M-400, I've owned/operated both.

Output on both amps was identical. Based on asthetics and on some internal construction differences, I would give the advantage to DaveMade. You'll be collecting Social Security before you final get a "NoName" delievered. DaveMade was slow, but NoName is the slowest of all!

.... you sayin' that a 102" whip won't resonate without a car under it???
Add a few 102" wires to the base of ANY mobile antenna's coax shield
connection and it should tune up with minimum fuss. The car only represents
a counterpoise, just as the wires would, or for that matter, just as the
ground in the yard would, assuming you mounted the mobile antenna ON the top
of the ground rod.

: things in life.

Some of us are not so fortunate. I have to pay for both my on-line time and the byte count. I have to download messages before I can tell if they are spams or not.

The difference between junk mail and spam is that, for junk mail - I do not pay for getting the junk to me - that is paid by the sender. I don't have that choice with spam.

By the way - SPAMs are messages sent to multiple off-topic newsgroups. An advertisement to one newsgroup is not a SPAM. That does not mean that the message is desireable to others that read the group.

Negative. As I have no license, I could transmit with 10,000 watts on 3.900 causing a stir. When the FCC came to investigate they would treat the matter differently than if I had a license. Now they would be compelled to stop the interference with the amateurs, but the legal basis would not be the same as with an amateur.

And let me be clear. I'm jumping in on this thread just to make a point about licensing, not to comment on its original purpose. Ham licensing has a long history and amateur radio is an honorable pursuit. My concern is for a government that has gone far beyond its original purpose and in many cases has lied and defrauded the public over licensing issues.

>

Due process is a component of common or Constitutional law and is only concerned with criminal matters.

Administrative law is not law but regulation, and only has merit when dealing with a signatory of that regulation. Thus the license agreement. Without the license the regulations that apply to amateurs may not apply to the general public.

>
> 73 de Phil Kane - K2ASP

Well Phil, I'm sure you're proud to be a ham and involved in
such a serious way. First, an unlicensed airwave transmitter
is not an operator in the technical sense. It may simply be a
short causing major interference on a ham or BC band.

A warrant for what, to do what, to whom? Was someone killed?
A robbery perhaps? Search and seizure? Sounds pretty drastic.
The only time the (American) public and its airwaves have been
subject to the type of control you suggest, was during WWI and
WWII and then under emergency war powers. There would be
an action as I describe above but it would fall under interference
with interstate commerce and it is not a criminal act in and of
itself.

Your license however does specify that you, the licenseholder, will
allow them entry to your station whenever they want and to 'search
and seize'. That's your agreement with them. The public has no
agreement with the FCC. You get nothing in return as the airwaves
are public anyway and cannot be verboden. The reason for the license
is to allow easy control of those airwaves by the government. Most
hams agree that this is a good thing. I agree that control is necessary
but that the FCC is not the best way to do it.

Some of you guys are real hot on 'law and order' but you must realize
that there is a big difference between a crime against a person (the
only real crime) and a regulation that is designed as a management
tool for the public good.

: So gps is only accurate to 100 miles +-?

Note I said "directional fixes" - which was in answer to the original question. GPS tracking has nothing to do with direction. It uses the time difference of the received signals to calculate the location.

The same could be done by satellite - but that was not the question that was asked.

Not necessarily true. The antenna does not know that it does not have a
ground plane. It will still radiate the power fed into it, although the
radiation pattern will not be as good as a person might desire.

I have used a mobile antenna as a base station antenna on occasion, when
nothing else was available. It worked ok.

: By the way, Like the CB Ops stated, It is not illegal to sell,
: purchase and possess amplifiers and Export radios, Only to use them!
: FCC Had better give the shop there money back!

Wrong. It is illegal to sell new amplifiers capable of operating on 11-meters to unlicensed people. You are correct that it is not illegal to purchase or possess such amps. It is illegal to sell Export radios in this country, unless they are actually going to be exported. That is because they are easily modified to operate on 11-meters, and are not type accepted for such operation.

: Who fines the FCC for purchasing this equipment?

No, one - as it is not illegal to purchase such equipment.

Two 14's @ 15v will do 100-110rms in class C, depending on radio drive, 4 14's will do about 190-200rms.
Your typical "Boomers" and the like in normal car voltage (13.9 or so) with a Cobra 29 or similar driving it should peak around 375-400. The same amp custom built in class C would do around 425-450.

Source record: 29762

First off, a spring is part of the 'calculated length' for proper performance. Although with a 102" whip the length is pretty non-critical since there aren't any coils. (The springs usually (ok, the better springs) have a shorting braid internal to the spring. Just flex one and you will see it.) But mainly for mechanical reasons. Yeah, it will 'flex back' in the wind at speed. But they are worth it if you bang anything low.

How about correctly specifying in your subject line that this is
an auction and not a For Sale? Some people get kind of
pissy about that, and may flame, but other people just go
right by the ad when they find it.

Just put a "FA:" as a prefix on your subject line. Keeps a lot
of people happy.

Mike

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 35.00 plus shipping.
Great deal ! ! !!
A Picture can be e-mailed.

>treat the matter differently than if I had a license. Now they would be
>compelled to stop the interference with the amateurs, but the
>legal basis would not be the same as with an amateur.

True.... you wouldn't have a license to loose, but the FCC would treat you the same license or no. The fine would be the same... Any legal charges would be the same... the only big difference would be the fact that you'd have no license to be threatened with the revocation of. (..you may even find you qualify for a few extra fines and penalties due to the lack of a license)

You don't have to have a license to drive a car, practice medicine, or pilot a plane, but the penalties for doing so without a license would generally be a bit higher for the unlicensed offender as more charges would be brought.

>Administrative law is not law but regulation, and only has
>merit when dealing with a signatory of that regulation. Thus
>the license agreement. Without the license the regulations that
>apply to amateurs may not apply to the general public.

...So you believe that if you never get a driver's license that you're immune from prosecution for drunk driving or speeding? ...That if you practice medicine without a license that you're safe from any malpractice charges?.. BULL!

>Your license however does specify that you, the licenseholder, will
>allow them entry to your station whenever they want and to 'search
>and seize'. That's your agreement with them.

.... I hold several Commercial licenses as well as a Ham license.. NOWHERE on the license or the application does it state the above....

>The public has no
>agreement with the FCC. You get nothing in return as the airwaves
>are public anyway and cannot be verboden.

...Old argument... if airwaves are 'everyman's right' and 'publicly' held, then what pretense do you base land or water rights/ownership on?

Ok, thank you. I broke out the manual this weekend and it stated that if the mobile lost power due to unusual circumstances, it can lose it's memory. I guess blowing a fuse is "unusual" enough to discharge the cap and lose the memory. That explains it, thanks again.

Use ohm's law. Voltage times amperage equals watts. Devide 45 watts by
13.8 volts to determine the amperage. You can also hook up an amp meter to
see the amps actually drawn by the radio. Three and a quarter amps is in
the ball park. Use a 5 amp or larger supply. Bigger is better

Ok loser. Describe to me why these so called pos "coily" antennas are so bad.
What antenna do you use? Maybe since you are such a pro at this i should be
using what you have. Maybe i've been mislead all this time. Secondly. Yes i
talk on 11 and 26 sometimes but not all the time. It is very possible, and i
know your seldomly used little brain finds this hard to comprehend, that i do
talk with others on different channels and hold some nice decent conversation
for a few hours. So if we bother you just sit back and shut up because you sure
the fuck can't do anything about it.
Hope to hear ya one day (yea right)

>Correct. But I was answering the original question - which WAS about
>using directional fixes.

In Usenet, the articles are arranged in a tree that shows which article
you are following up - i.e. which one you were reading when you wrote your
reply. If you had followed up the *original* article, it would have been
clear that this is the context that you were replying in.

Instead, your comments about directional fixes from satellites were
posted as a followup to and article that was clearly talking about
using Doppler effects for position location, not directional fixes.
That's the context of your article, and that's why it caused so much
puzzlement. You weren't contributing to the discussion in progress
in that thread, but leaping back to the original question.

If you wanted to comment on the original question, it would have been
better to post your article as a followup to *that* article.

My Cobra 132 XLR has been modified for the range of
26.645 to 27.585 and has a handy 5 kc drop switch.
A technically competent aquaintance told me if I found the
appropriate crystal he could shift my extras from mostly lower to
mostly highter (above ch. 40).
The pll is the 5080P.
Could someone please point me in the right direction, thanks.

If a radio, say a Cobra 29 LTD Classic, which is a single final radio, how is it electronically possible for it to produce 30+ watts peak when peaked and tuned? Even if you replace the stock final with a 1969 final, I thought that final was a 16 watt final. If so, how can you TRULY get more than that out of a radio? I see some shops claiming to be "tuneup experts" saying that they can get your radio to do some of these 30 and 40 watts readings on a peak reading bird meter.

About a month ago I tried to do a deal with this person.
The story I got was fishy. He also would not do escrow. He told me he needed cash asap.I told him to send item to my place of employment and gave him my phone number. I would air freight the cash as soon as I got the item. I did not trust this person and I`m glad that I didn`t send the money order that he wanted. I never got the item and I got no response when I sent emails.
Be smart, don`t deal with this person.

> Where can I find modification details to include the CB band?

Alex

I have one of these and yes its quite easy to use, havent had any
problems
with it. To modify it for 26-30mhz. you have to install a chipswitch which
is a new 64 pin Eprom. Its not a job for an amateur. The easiest way to do
it is
to cut out the old Eprom and solder a 64 pin socket in its place and pop
the new Eprom in the socket. To solder it in pin for pin can be disastrous
cause
you have copper traces on both sides of the board and soldering that close
an
eprom can ruin the chip.

Jeff

> charges?.. BULL!

I'm not arguing against guidelines in these matters but only how
they're implemented. Your responses do point out one of the
weaknesses of the system, while I suppose all States have passed
laws against practicing medicine without a license, how would a
malpractice suit be filed since technically only practitioners have
licenses? Such a charge for damages would have to be something like
malicious assault or intent to do bodily harm. Then the court
would have to prove intent or fraud or whatever the charge
might be. No, such licenses are there to protect the business side
of medicine. Doctor-caused deaths and hospital-caused illnesses
run around 1.5 million a year.

The driver license senario is easier. Drive without a license and
hit a pedestrian. Assuming that it was your fault then the pedestrian
files the same charge as if you ran him over with a wagon or on
a bicycle. If it wasn't your fault then you get charged with driving
without a license. Remember, all of the traffic laws are municipal
or county regulations from the corporate city or county. If you do
not have a license then you are not charged with those. You will
be charged for any personal or property damages incurred by
your actions.

>

I could have sworn that the FCC license agreement with amateurs
stipulates that the FCC has a right to examine your station equipment
as it wishes.

> >The public has no
> >agreement with the FCC. You get nothing in return as the airwaves
> >are public anyway and cannot be verboden.
>
> ...Old argument... if airwaves are 'everyman's right' and 'publicly' held,

Again, I'll be the last one to argue against the need to manage
airwaves etc.

That's right....instead of a penalty for violating FCC Rules
you would be hit with the same or greater penalty for operating
without a license which is a OS Code violation.

>> Administrstive proceedinhs ARE due process - one is given
>> notice of the offense and the opportunity to respond and

>the license agreement. Without the license the regulations that
>apply to amateurs may not apply to the general public.

I don't know where you get that (actually I cnn make a good
guess from your phrasing but do not consider it a source of
accurate legal information or education).

>
>Well Phil, I'm sure you're proud to be a ham and involved in
>such a serious way.

I'm also proud to be an attorney who specializes in US and international communications enforcement and regulatory law and who has spent over 20 years teaching that subject. In fact I was one of the principal writers of the FCC's internal search and seizure and forfeiture guidelines and practice.

How many years have YOU worked in and taught comm law?

>First, an unlicensed airwave transmitter
>is not an operator in the technical sense. It may simply be a
>short causing major interference on a ham or BC band.

In a techical sense the "operator" is the person/agency responsible for putting the transmitter or other radiating device on the air or for keeping it off the air, as required.

>A warrant for what, to do what, to whom? Was someone killed?
>A robbery perhaps? Search and seizure? Sounds pretty drastic.

That's exactly what it is. A warrant from the US District Court directed to the US Marshal or to any authorized Federal law enforcement agent specifying the premises to be entered and searched and the property (if any) to be seized.

The situation does not have to be criminal in nature - for instance a warrant is necessary (and I have had first hand experience with getting same) for the FCC to enter unattended or unoccupied private property in case of accidental or inadvertent transmission causing harmful interference (a legally defined term) to radio communications,

>The only time the (American) public and its airwaves have been
>subject to the type of control you suggest, was during WWI and
>WWII and then under emergency war powers.

Where are you getting this nonsense? (Same place as above, I suspect.)

Go read the following sections of the Communications Act (Title 47, United States Code):

501 (criminal penalties for violation of radio law statutes),
502 (criminal penalties for violation of FCC regulations),
503 and 504 (administrative penalties and procedure for violation of either statutes or regulations)
510 (standards and procedures for seizure and forfeiture of equipment).

These statutes are in effect at all times, At no time is there
any exemption for persons who hold or do not hold licenses.

>Your license however does specify that you, the licenseholder, will
>allow them entry to your station whenever they want and to 'search
>and seize'. That's your agreement with them.

As you have been told by others, there is bo such thing.

There is a whole set of FCC Rules which obligate persons to
make radio equipment available for inspection "at any reasonable
hour", which has been defined to include any time the station
is in operation or shortly thereafter.

>The public has no agreement with the FCC.

FCC Rules apply to all persons, licensed or not, and the
sections of the Act cited above make non-licensed persons just
as liable to penalties as licensed persons.

>You get nothing in return as the airwaves are public anyway and cannot
>be verboden.

"Airwaves are public" ? Urban myth.

>The reason for the license is to allow easy control of those airwaves
>by the government.

"Easy control ... by the government" ? Another urban myth.

You're loaded with 'em.

>Most hams agree that this is a good thing. I agree that control is
>necessary but that the FCC is not the best way to do it.

It sure beats any other alternative.....

>Some of you guys are real hot on 'law and order' but you must realize
>that there is a big difference between a crime against a person (the
>only real crime)

Most qualified legal experts will disagree with THIS urban myth.

>and a regulation that is designed as a management tool for the public
>good.

Smoke and mirrors.....go and learn.....

LEGAL CABLE TV DE-SCRAMBLER

Want to watch Sporting Events?--Movies?--Pay-Per-View??

*This is the Famous R-O Shack TV Descrambler
You can assemble it from Radio Shack parts for about $12 to $15.

We Send You:
1, E-Z To follow Assembly Instructions.
2. E-Z To read Original Drawings.
3. Total Parts List.

**** PLUS SOMETHING NEW YOU MUST HAVE! ****
Something you can't do without.

THE UP-TO-DATE 6 PAGE REPORT:
USING A DESCRAMBLER LEGALLY

Warning: You should not build a TV Descrambler without
reading this report first.

Frequently Asked Questions--CABLE TV DESCRAMBLER

Q: Will the descrambler work on Fiber, TCI, Jarrod
and satellite systems?
A: The answer is YES. In respect to satellite,
you just get more stuff! There is one exception:
The descrambler will not work with DSS satellite.

Q: Do I need a converter box?
A: This plan works with or without a converter box.
Specific instructions are included in the plans for each!
Q: Can the cable company detect that I have the descrambler?

A: No, the signal descrambles right at the box and does
not move back through the line!

Q: Do I have to alter my existing cable system,
television or VCR?
A: The answer is no!

Q: Does this work with my remote control?
A: The answer is yes. The descrambler is
manually controlled--but very easy to use!

Q: Can you email me the plans?
A: No the program comes with an easy to follow picture guide.

Q: Does this work everywhere across the country?
A: Yes, everywhere in the USA plus England,
Brazil, Canada and other countries!

Q: Is this deal guaranteed?
A: Yes, if you are unhappy for any reason we will refund your money.

Q: When I order, when will I get my package?
A: We mail out all orders within 24 hours of receiving them.

Q: How much does it cost to get the instruction
plans, the easy to follow diagram, and most
important of all the "Using a Descrambler LEGALLY Report".
A: You get the complete 6 page report and instruction package all for just--$10.00

Q: How do I order?
A: Fill out form below and send it, along
with your $10.00 payment to:

CABLE FREE-TV
12187 S. Orange Blossom Trail #116
Orlando Fl 32837

(Cash, Check or Money Order.)

(Florida residents include 7% Florida State Sales Tax)

(All orders outside the U.S.A. add $5.00)

>Because they don't take directional fixes.

Don't you really mean - because they "do" take
a directional fix... After all - without a direction
component - you can not resolve a direction.
Since a direction IS resolved from the satellite
then - ergo - there must be a direction component.
And with two direction components - you have
a fix. Simple idea - Simple math - simple system -

I have for sale a Uniden Washington with uppers in it. The radio is in good condition except for two small holes drilled in the top cover where an amp was mounted at one time. This radio comes with a D104 silver eagle mic that is in mint condition. I would like 150 + shipping. This radio recived excellent audio and signal reports from all over the country.
I also have a Teaberry Model "T" 40 channel Tube type base. This radio is in near mint condition and all tubes are 85% or better. This is one fine AM radio or in collectors condition for 40.00 + shipping. Comes with the original stock mic
(I didn't need a power mic for this one).
Last but not least I have a "new" Texas Star 667V I have the box and the limited amount of paper work that came with this amp. This is one loud box and the only reason I am selling it is that I have ceased operating in the mobile. I would like 400.00 + shipping on this one or I might do some trading for Ham gear.
All of this stuff is garunteed to arrive alive and be as stated. You will not be disappointed.
Thanks
Andy

Sound Tracker is a small but significant step forward in CB
technology. If you don't have it, you won't miss it; but if you have
it -- and elect to use it -- you will simply experience a better
signal to noise ratio. It quiets the background noise without
affecting sensitivity, in my experience.

It seems to have no effect on transmission -- near as I can tell.

It works -- really well... I have several CB's, only one with
Soundtracker -- now it's the only one I use.

389. FS 4-PILL

Newsgroup: rec.radio.cb
Date: 2000-04-03 00:00:00 UTC
From: G SEVEN <superiorwavelength@prodigy.net>
Message-ID: <8cb3cm$18ge$1@newssvr04-int.news.prodigy.com>
Source record: 29839

This is a newly built 4-pill (2sc2879's) $275.00 Does a 400 watts on a bird and a 900 on a Dosy meter. That's being driven with one SD 1446 pill @ 13.6v and a 90 amp alternator. I have tested @ 18V and did a 1000 Bird watts. I don't recommend this at all, but just letting you know that I have tried it. This ams got swing for days.....

Check out the picture.

Run the power leads directly to the battery. The whine is coming through
because the -supply leads- are being shared with everything else in your
vehicle.

Hahaha.. grow a skin...

This is my original post for those getting lost in this thread, and I quote:

"Just a request. Could you please make the subject FS: instead of the
astericks and whatnot. There are NO rules regarding this, just a commonly
known courtesy extended between one another, usually. Thank you in advance."

and here is Roly's, or Mr. Roly's (since we are now being formal) reply to
the above:

"Wow. Seems like i'm batting a thousand on this group! If I didn't know
any better i'd think this was a retirement community. Alot of irritable
peeps here......I'll try my best to carry myself appropriately dad...."

Take care Roly... nice getting under your skin...

There is no such thing as "watts rms". Electrically, one can only
extrapolate the mean square of a voltage.
I know that, because I am better than you are.

CB is excellent, for listeining on the freeways for any traffic tie ups as
well as speed traps. Channel 19 is an excellent source of info.

Handheld CBs though perform poorly when used inside a vehicle.. unless an
external antenna is used.

Message-ID: <38EA6A1E.8B068F88@labs.tamu.edu>
Source record: 29870

Hello everyone !!

I had been using a mag mount base loaded antenna for a while now, but I have been hearing all the positives of the fiberglass permanent mount. So I oredered a dual firestick II 4' with the mirror mounts kit. I have a Ford Explorer sport, and couldn't come up with a better way to mount it than on the luggage rack. It's high up and pretty convenient. There is only about 2 1/2 feet between the 2 antennas, but I did run a 12 ga. grounding wire from one mount to the other, then to the body. I hok it up and try to tune and I get a SWR of about 3 or more... well I tried playing with the ground wire to different parts, adjusting the length. Nothing worked. Then I tried to use one of the 4' Firestiks in my mag mount. It had a high reading too(3+). I was baffeled. I tried my old base loaded one and it read 1.25 -1.3 SWR. WHAT is the problem ?? Can anyone HELP me ?? All help will be greatly appreciated !!!

Hello. Selling my TeleStar amp. Uses a pair of 4CX350F tubes. 4 watts in gives 700-800 watts RMS dead key out. Shows about 1500 watts PEP. Readings taken on a Bird 43P with a 2500 watt slug. In good cond. inside and out. Has some small scratches. It is about a 6-7 on a 1-10 scale. Works great! Price is $800.00 + shipping from 96003.

Take care,
Stan (530)241-0843

Well, if you have something for sale, or if you are looking for something, or just need help, you may want to post a message on the new CB City Swap Shop.

It will now email you when you have replies to your ad, and you can also just look at topics, or set your own without having to read the entire message.

So if you want to sell your stuff, and know when someone has replied to your ad, go to the Main Page on the CB City website and click on "Msg Board" and you can check it out.

I hope that this Helps all of you in your CB or Ham Adventures.

The URL to CB City is in the header of this message.

See you there!

Dean
CB City Manager

The FL-2100b has a tuned input. The 'best' make of
572b is going to be a matter of personal preference. I've
seen problems with the 'chineese' tubes, depends on how
'cheap' they are. Svetlanna tubes are very good, a bit
more expensive, but worth it. If you can find any USA
made tubes, god luck. Haven't been made here in several
years.
Do some comparison shopping when buying tubes. Prices
seem to change over night some times. The most consistant
seems to be RF Parts (never loose the reciept!!).
To 'key' this amplifier you need a switch/relay that
will 'sink' about 110 volts. Not sure what the Frb-757
is, but if it's an outboard relay, it'll probably work.

The Federal Trade Commission and stereo mfgs and retailers will be amazed at your new discovery. It negates their existence since the FTC made RMS wattage mandatory on all stereo gear as the standard of rating output to this moment.

The only difference in RF and AF output is the frequency. Maybe you can straighten the rest of the electronics industry out while you are in the enlightenment mode of operation.

"A. H.",
If I understood you correctly, you tuned the antennas
by varying the ground wire? I probably didn't understand
you correctly. Anyway, check if 'one' of the antennas is
too hi, or low (SWR lower on the hi end of the band, or
the low end). If it's lower on the 'low' end of the band
your in luck. Pull the top-cap off the Firestick and look
inside. There should be a section of wire that you can
'fish' out of the 'tube'. You can use this wire to tune
the antenna. Don't pull it too hard when you 'fish' it
out!.
Two 1/2 feet is too close, no point to haveing two
antennas if they're that close together. They need to be
about 8-9 feet apart to do any good at all.

Do you really have to yell this out! Cap Locks are located just to the right of the "A" key you will know that you have the caplocks on when you see the indicator light on your keyboard is lit. Please, please, in the future make sure that the indicator light is off.

Hi,
I am thinking about purchasing a K-40 CB radio. I saw one on the web on a site called allradios.com. It says something on the site about Forrest communications. Does anybody know anything about these two organizations. Has anybody ordered anything from them and have you had any problems?
Thanks
R.P.

i think it was posted earlier. i went to it and looked around. very
nice. good job. i saw radio equipment i haven't seen in a long time.
seems a lot of people use old out dated radio equipment up there. oh
well. i sure hope they have access to a large supply of tv sweep tubes.

also these guys are operating big stations within neighborhoods. wow, how can you do this and get away with it? seems like their neighbors would be continually raising hell about it with uncle and whoever else would listen. but whatever, their stations looked real nice,......cd is out.....

456. Mobil CB Speaker Whine

Newsgroup: rec.radio.cb
Date: 2000-04-04 00:00:00 UTC
From: keninma@aol.com
Message-ID: <20000404114648.06577.00000633@ng-fa1.aol.com>
Source record: 29906

Ok, well I have very good readings on my SWR meter for all tested channels (1.2 or less). My power output seems to be restricted though. With the engine off, I get a reading of about 2 watts and with the engine running I get about 3 watts (I am wired to the "unswitched aux. wire and grounded to the body). My antenna is mounted to the tailgate of a 99 Wrangler. I ran a separate ground from the antenna mount to the frame rail using 10 ga. wire. The only difference this makes is to increase the noise from the external speaker...no change in SWR or power. Any ideas?

Thanks

Ken

Mount it on the bumper. Take off the plastic bumper caps, drill
one of the holes out, and put a stud mount in there. Run an extra
ground from the base of the mount to the frame. Also, all the radio's
I've used pick up fuel injector noise. The best one has been the
TRC-451 (Cobra 146 clone) that's in there now. It feeds a KW-7
mounted to the bumper as noted above.

I'm only gonna write this once Mr. Jeff Herrings so pay very close attention! I could give a rats ass what you think and even more what you say. I didn't ask for your opinion nor is it appreciated. You seem to have a illusion that you are god here, but let me reassure you that you are NOT! So keep your smart ass, english teacher bullshit to yourself. i'm very sure nobody appreciates your crap here. if any others dislike the *** deal, OH WELL! Cry somewhere else. I can care less if the items get sold or not. Unlike you I do not depend on this toy for income. Maybe that is why you are so anal here on this group? I don't know and once again I don't care because it is NOT my business nor do I want to make it. So on this note I hope you really grow up and learn to keep your MOUTH shut and your opinions to yourself. I guess Mommy didn't teach you that so i'll have to inform you on your behavior. Grow up, and live your own life and stop worrying about others cause woman are mostly the ones whom do that. Bye, bye Mr. Soap opera.....

tim it's like this. this is a prime example of imaturity. He really needs to mind his own business and put as much effort as he applies on here to his life. That is if he has any chance of having one. This is one of them gossip starting guys on the radio. The little "whore" if you will. Let him be because ultimately he is making a fool out of himself. Take it easy.....

No, Ken, someone who purchases FRS for occasional use will be very
well served by using Alkaline batteries. Most users will use the
radios on occasional shopping trips or road trips. Since the stated
life for a set of alkaline batteries is 18 - 20 hours, that would be
more than enough for that particular shopping trip or vacation travel.

If they are using their two-way radios more than 22 hours t a time,
they would indeed be better off with NiMH batteries, but I would guess

that most users of that sort would be using cell phones anyway, and, of course, NiMH batteries are standard or an option on most, if not all, cell phones.

If the poster doesn't already have the CB units, he will end up paying
more for hand-held units than he would for the FRS, so I would say no,
CB would not suffice, since the FRS would offer him more of the
specific capabilities he is seeking.

Ken,
With a power difference like that, I'd say the reason is a change in the available voltage. How well is your battery charged? Also, tapping power from an ignition switched point isn't the best idea. You may be getting this power difference because of inadequate wiring(doubt it, but maybe). Always run power leads for radios from the battery.
If your getting more noise from your speaker with the ground lead connected, and the motor is not running, then your getting more 'signal'. If your getting more noise only with the motor running, then I'd say your picking up noise from the ignition. If I'm understanding you correctly, the antenna is mounted to the 'tail-gate'. The ground wire may be making a 'noise' difference because the tail-gate isn't adequately grounded to start with.

483. Re: Putting a amp in a mobile radio?

Newsgroup: rec.radio.cb

Source record: 29933

Beedman007,
sorry, it just doesn't work like that. Replacing the
final transistor(s) in your radio would do little good
when you compare the results to 'most' out-board amplifiers.
There wouldn't be enough 'gain' in power by changing the
transistors inside the radio with out making quite a few
other changes also. Those additional changes would be just
like re-bulding the radio. Why bother?
And as to powering the thing from the 'lighter', no, you
would never get enough 'current' from the lighter to power
an amplifier. the fuse and wiring is too small to handle
the number of amperes the amplifier would draw.
'Doc

Hi All,
This is my first time on this Newsgroup. I am looking to buy a K-40 CB. The small town I am from doesn't sell them. I live fairly close to St. Louis Missouri. Does anybody know what stores sell these CB'S?
Also, anybody have any input on through the glass cb antenna's. I know the range won't be as good as a wired direct antenna, but is the range "cut back" dramatically?
Thanks to all who help,
R.P.

With the front of the radio facing you, jump a wire from the middle pole of the pa switch to the left pole of the fine tune pot. Remove the tow lower wires of the pa switch, and solder them together, or you will be in pa when you go negative 10. There is a jumper on the board right behind the fine tune pot. Solder a wire from that point to the pots other pole. That way it will work on tx and rx.

>So what you're saying is you should throw good radio procedures out the
>window
>and just buy kilowatt amps and talk over each other?

Where the fuck have you been??? Good radio procedures is long gone. That went out with the hula hoop. Even when talking on a base with friends you still get a couple of boneheads out there causing "hate". The CB to me is fun no matter how i use it. If you can only seem to enjoy it when following strict rules then you are much better off on 2 meters, 440, or just h.f.
And to top it off, do any of us come on here saying how stupid it is to hold regular conversation. I think you are way out of line saying how stupid skip shooting is on channel 6, 11, or 26 and you are in no position to challenge.

Once again,

73's's's's...937 Illinois top side is back on the mail!!!!!

>a directional fix... After all - without a direction
>component - you can not resolve a direction.
>Since a direction IS resolved from the satellite
>then - ergo - there must be a direction component.
>And with two direction components - you have
>a fix. Simple idea - Simple math - simple system -

But it's not how the ELT location system works.

Ultimately, you're trying to establish a *position* for the transmitter.

You can do this by taking angular bearings from several locations, and
then see where the bearing lines cross. That's how much land-based
radio direction finding works.

You can find a position by measuring absolute distance from a set of
ground stations using the time it takes radio signals to propagate
from one to the other. Once you know the distance from each ground
station to the target, you can draw a circle of that radius around
the location of each station and see where the circles intersect.
Simple in principle, but requires precise time sync between transmitter
and receiver.

In practice, this is actually done by measuring the *difference* in
time of arrival, not absolute time of arrival, of radio signals.
For any two fixed stations, a third station that sees a given time
offset between signals from those two stations must be somewhere on
a hyperbola of constant time offset. Use 3 or more stations in
pairs, and you get 2 or 3 of these lines, and the intersection tells
you where the unknown station is. This is how LORAN works, and GPS
is very similar.

But the ELT-finding system uses non of these methods. It uses the
moving satellite and a ground receiver to measure Doppler shift of
the ELT transmitter. For a given instant in time, the locations on
the ground that can have a particular Doppler shift as seen by
the satellite forms a particular line along the ground. But as the
satellite moves, the Doppler shift changes, and the shape of the
line on the ground with that particular Doppler shift also moves.
There will be only one point on the ground that gives the *particular*
pattern of change in Doppler shift seen from one or two continuous

satellite passes.

So the system can establish a position on the ground, without ever having the ability to take a directional fix at any instant in time. In fact, the satellite doesn't even have any measuring equipment on it - all it does is receive the signal at one frequency, translate it to another frequency and retransmit it. All the measuring electronics and computation hardware is on the ground.

Dave

No reserve. Starts at 99.00. Auction ends 4/11/00. I think it's a prototype. It has ony 6 xmit channels (the tr-27-c has 8.) The top is smooth with no louvers or access to x-tals. 2 minor scatches on face plate. Loud audio.sensitive tunable receive. e-mail me for more info. Thanks for looking, crazybob.

From: David Little <dalite01@sprynet.com>
Message-ID: <8cdjd4nip1@slb3.atl.mindspring.net>
Source record: 29944

Gee,

I musta done good with the last ten I bought in the original JAN sealed can at $15.00 each......

5960-935-4981
ELECTRON TUBE
ONE EACH
DSA900-69-C-2503
(A) 1/69
TYPE JAN 7203
MFR. EIMAC DIV. OF VARIAN

Excuse caps. Direct repro of label on can.

I just got an inventory of over 800 tubes of all kinds. From the looks of these messages, I should be able to send my dog to college from what I can get from them.

(Little Hint - If you don't pay these prices, they can't sell them for these prices. If you pay this price, it is 100% assured the next one will cost more.)

I have kept the JAN 7203s for a rainy day. Most of the ones I have used in the past were pulls from Radio Station exciters that usually sell for $5.00 a pop, and are 85% or better.

Hint - Use the 17, 21 0r 38 volt filament versions of these, and buy the filament transformer and a spare one from the savings on the first tube at these prices. Buy 4 spares for what one of these are listed for.

Profit is a good thing. Rape is still a crime (Unless money has changed that too.)

I'm not familiar with the K40 CB, but I would guess that it is no better
than anything else around the same price. I have the Cobra 148GTL myself
and would recommend that highly. Every through-the-glass CB antenna I've
seen worked very poorly. I believe your money is much better spent on a
magnet mount antenna.

MC

You must increase the voltage to increase the power along with the tuning and limiter pull.

,,

well it is like this it has a driver 2028
a1969 final is 20watt final sometimes you can get a hot one which gives you a little more. then there is the little tricks that are done to squezze a little more power out
the power they are telling you is reak evelope power which would be 10to12 watts rms enjoy 1iwilly

The Antennas I put on eBay are sold for a set price, there is no
"bidding up" the price. Therefore, I believe it is more correct to list
them as for sale rather than for auction. Furthermore, I believe the
potential to be passed by is much greater with a FA than a FS listing.
You can never keep everyone happy, especially on the newsgroups.

Not only is it safe to say that, that is the PURPOSE of "rec.radio.swap".

However, note that this thread was originally cross-posted to 5 newsgroups, each with a separate charter (if any) and separate topics. There is no "the charter" that covers all 5 groups (or even the 4 that this response is going to).

I use two of them and have never had a problem. There great little radios for the money. I really like the FM capability. The extra 600 or so frequencies (with the 5 khz switch) are nice too.

>laws against practicing medicine without a license, how would a
>malpractice suit be filed since technically only practitioners have
>licenses?

Good point... perhaps that was a poor analogy, but the unlicensed
practitioner would still be hauled into court... THAT's the point... and the
lack of a license would make for MORE charges not less.

>No, such licenses are there to protect the business side
>of medicine. Doctor-caused deaths and hospital-caused illnesses
>run around 1.5 million a year.

Medical licenses are no there to protect the BUSINESS.. they are required by
states as a means to protect the PATIENT... you must have the degree and
medical board certification to BE a doctor, the license allows you to WORK
as a doctor.

>The driver license senario is easier. Drive without a license and
>hit a pedestrian. Assuming that it was your fault then the pedestrian
>files the same charge as if you ran him over with a wagon or on
>a bicycle. If it wasn't your fault then you get charged with driving
>without a license.

...you lost me there... faulty logic. License or no the charges will be the
same and probably harsher for the unlicensed driver.

>I could have sworn that the FCC license agreement with amateurs
>stipulates that the FCC has a right to examine your station equipment
>as it wishes.

...Not in so many words.. it says only that "the authority granted (your
license privileges) is subject to the orders, rules, and regulations of the
FCC, the statutes of the US, and the provisions of any treaty to which the
US is a party, which are binding upon radio operators." The rules and regs
of the FCC DO stipulate that inspection is an FCC option, but it is NOT ONLY
for licensees... it is for any STATION licensed or not. Visit the FCC
website and READ this page... the url follows:
http://www.fcc.gov/eb/inspect.html

BE SURE TO READ THE VERY FIRST LINES... the FCC's authority and existence
was granted by and created by Congress.

>> >The public has no
>> >agreement with the FCC.

Oh no?..... go back to the above URL and reread.

> Give that answer on a law school exam and lose 10 points......

I've no doubt of that. Administrative proceedings are the
rules of the agency for which they were written, obstensibly
following congressional desires.

Administrative proceedings use the rules written by the
agency for the agency to enforce the prohibitions and permissions
of the agency. Administrative processes are designed to take the
place of due process. Where is the jury? Where is the court?
It is not Constutional due process.

That is because administrative rules and regulations have nothing
to do with crimes against persons or property. The closest the
FCC comes to its congressional instruction is its original purpose
of regulating the airwaves for Interstate Commerce.

There may be some hams still around from the time when the federal
government decided to kick the operators off their preferred frequencies
and stuck them with higher bands that didn't work well with equipment
of the time. Did the do this to benefit the public? No, it was said
to be for commerce. Because a deal had been cut with RCA and
other lucrative contracts and Tesla was out of the way, the road
was paved for a rosy future. But first it was necessary to pacify
the public and force licensing in order to ensure control.

Understood. And is the legal basis of this is the Commerce clause?
That is, the interference with commerce across State lines? Or would
this drastic action be warranted because of security reasons?

Why not wait for the householder's return. Or call them or leave
a note. Sounds like imminent danger.

These were in effect in 1940? Special legislation was put in place
for both wars that dealt with the general public.

I'm not suggesting that there is an 'exemption'. I said, in so many words,
that amateurs are held to a different standard, that they are expected to
know what is permissible as that is in part the purpose of a license.

There is no exemption unless there is a presumption of ownership.
And the presumption on the part of the FCC is that some part of
the federal government owns the electromagnetic radiation spectrum
and then makes 'exemptions' where there is no license.

What persons? All persons? Then these are rulings and not law.
This set of FCC rules sounds like the ones I alluded to. Obviously
they cannot apply to those who have no such equipment so they
must apply to those the FCC knows has this equipment, the
license holders.

>
> >The public has no agreement with the FCC.

So the FCC can obtain a warrant and enter any persons household
and search and seize and forfeit whenever it thinks it is warranted.

>

Qualified legal experts are precisely why the US is in such a precarious position. Most citizens by far care little and know less about interfering with radio waves. Like a busy intersection without a stoplight, drivers learn to cooperate thus allowing the traffic to flow. I've seen this many times before stoplights were put in place, sometimes causing problems. This because a programmed stoplight cannot adapt to un programmed conditions. Such is the case with the massive body of law and regulation. It develops and encourages dependency and is not capable of adapting to conditions making justice a theosphical theory and efficiency impossible.

What has happened to CB radio since the first days of licensing? It got raucous and nasty, quieted down and emerges years later as a workable system to the point where self-assigned numbers and names serve as identifiers. A crude example since the frequency is not very good for distance or local, the general public was never involved and the only knowledgable people, the hams, never invested their expertise to educate the CB users. But like the intersection example, solutions do emerge without the need for heavy handed law.

I think you would have saved yourself a lot of pain and exasperation, if you used the word "improbable" rather than "impossible", when making your statements. There are a lot of radio types that do what, to me and probably you as well, would be extreme measures to chase those rare DX stations. There are many people that have made it their life's goal (God knows why) to work the world on the freeband. Many have gotten real close to doing it. Telling them that what they just did is "impossible", is no different, than telling someone that it's impossible to go around the world in a ballon, or any other extreme activity. The fact that it's difficult only make the challenge greater.

No no no. As a police officer the laws for traffic are 'state'
laws, not municipal or county. These agencies enforce the traffic
laws that are in the STATE TRAFFIC CODE. Also your license is
property of the state since the state is the one that gives you the
right to drive.

549. HELP with SWR !!!! (second explanation)

Newsgroup: rec.radio.cb
Date: 2000-04-04 00:00:00 UTC
From: "A. H." <a0h9065@labs.tamu.edu>
Message-ID: <38EAB5D6.D909B9A6@labs.tamu.edu>
Source record: 29999

Thanks for the responses everyone.. however I guess I didn't explain my problem too well..
I thought the 2 1/2 feet was too close.. but when i tried it individually in a mag mount it still read really high on the SWR meter. I do know how to tune the antenna and did try from the highest to the lowest point in the screw (the FSII has the easy tunable tip) I even took it out, but no effect. My regular base loaded Radio Shack Antenna gets a 1.3 SWR in the same mag mount. So what is the problem ?? The wire I mentioned was just to ground the mount to the body. I only mentined that I tried several spots on the cars body to make sure it was a good ground, but that didn't help any. So why is my Firestik get such a high SWR in the mag mount too ???

>Um, not always true, Dave, depends on what news reader one is using
>and what options one is using.

>Forte Agent allows sorting of incoming group by thread, subject,
>author, date or size, and most don't show the tree structure.

Well, my postings, the posting in question, and most other postings in the newsgroup ARE threaded, which is controlled by the References header line. Some people may choose news readers that don't understand the threading, or don't display it - that's their choice. But many people DO pay attention to the threading, since it helps make sense of the flow of conversation.

So it would be incorrect to assume that ALL readers see the threading - but equally bad to assume that NO readers see it. I would suggest that if you really want to post an article that doesn't fit into the normal threading tree, either move to the point in the tree where it *does* fit, or delete the References header line entirely so it doesn't appear as part of a thread at all. Better to provide no threading information than to provide incorrect information.

Dave

>I said they take a directional fix -
>You agree don't you?

No. At no point in time does the satellite know where the ground
transmitter is with respect to the satellite. That would be a
directional fix.

>I stated a direction IS RESOLVED from the satellite.
>You agree don't you?

A position is resolved, and a direction can be calculated.
This process takes examining the signal over time.
That's different from "taking a directional fix".

Strabo <strabo@flashmail.com> wrote:
>There may be some hams still around from the time when the federal
>government decided to kick the operators off their preferred frequencies
>and stuck them with higher bands that didn't work well with equipment
>of the time.

That was 1912; amateurs were restricted to the frequencies 1.5 MHz and higher ("200 meters and down"). Hams redesigned their equipment and discovered that the government had given them a gold mine -- they discovered that worldwide communication was possible on those bands that we now call the MF and HF frequencies.

>Did they do this to benefit the public?

Certainly. For example, it made transiting the high seas much safer.

>No, it was said to be for commerce.

And it *was* for commerce. Amateurs had to be segregated from the maritime and naval radio traffic, for, prior to 1912, it was a free-for-all -- amateurs intentionally interfered with ship-to-shore radio communications endangering the lives of all those on the high seas. Hams hindering the passing of Titanic-related traffic finally was the last straw. Radio law came into being. There are dozens of radio history books available which will document the total mess which existed prior to licensing; separation of the radio services *had* to take place.

>Because a deal had been cut with RCA
>and other lucrative contracts and Tesla was out of the way, the road
>was paved for a rosy future.

Whatever credibility you *might* have had just went out the Windows. RCA was created on October 17th, 1919, fully five years after amateurs were relocated up to 1.5 MHz and above. Prior to WWI, the only "broadcasters" were amateurs themselves; equipment was still very crude, most of it home-built. Only because of the World War did radio and electronics rapidly advance, permitting the concept of "broadcasting" to come into being. See "History of Radio to 1926," by Archer.

> But first it was necessary to pacify
>the public and force licensing in order to ensure control.

Nonsense. There was no concept of "broadcasting" which existed when radio law came into force in 1912; when radio was shut down in

1917 due to WWI, there was still no concept of commercial broadcasting.
None whatsoever.

>I have the advantage of not being a lawyer.

That's no excuse for not studying radio history.

>So a peculiar short in a powerline that causes interference
>an operator?

The responsible "operator" is the owner of that power line.

>Qualified legal experts are precisely why the US is in such a
>precarious position. Most citizens by far care little and know less
>about interfering with radio waves. Like a busy intersection
>without a stoplight, drivers learn to cooperate thus allowing
>the traffic to flow.

Poor analogy. In your intersection, drivers can see other drivers
and avoid interfering with each other. But as you pointed out above,
"most citizens by far care little and know less about interfering
with radio waves." Also, radio waves, unlike cars, are not visible;
an unknowing operator manning a transmitter can create a huge
swath of interference affecting aviation, maritime, broadcast, public
safety, etc. communications. Thus, a need does exist for government
control of the RF spectrum.

Your uncontrolled intersection with all drivers cooperating is a
fantasy; there will always be selfish drivers who will not cooperate,
leaving behind mayhem.

>conditions. Such is the case with the massive body of law
>and regulation. It develops and encourages dependency and
>is not capable of adapting to conditions making justice a
>theosphical theory and efficiency impossible.

Nice dream. It reminds me of the school of thought which says that
students have the ability to create their own mathematics necessary
to solve a given problem. That's like asking someone to build a
building without providing him the tools to do so. Give him the
tools, then he can build. Provide those students with the needed
techniques, then they can solve.

>What has happened to CB radio since the first days of licensing?
>It got raucous and nasty, quieted down and emerges years later
>as a workable system to the point where self-assigned numbers
>and names serve as identifiers.

Workable system? There goes your credibility again!

>A crude example since the frequency is not very good for distance or
>local,

A frequency is either useful for local or for distance communications (and, at different times, both).

>the general public was never involved

Part 95 communications was/is open to the public.

>and the only knowledgable people, the hams, never
>invested their expertise to educate the CB users.

The FCC's Part 95 regulations were/are all that's needed to educate those users: Power output limited to 4 watts, no external power amplifiers, antenna must be no more than 20 feet above its supporting structure and no more than 60 feet above ground, only FCC type accepted equipment, no internal modifications permitted, no obscene language, no interfering with others, no one-way transmissions, no music, whistling, or other sound effects, no communications greater than 155 miles, no communications with foreign users, et cetera. Many of the users have ignored the regulations causing the channels to become utterly useless. It's just like your make-believe uncontrolled intersection -- selfish drivers, ignoring protocol, causing traffic-jamming accidents.

>But like the intersection example, solutions do emerge without the need
>for heavy handed law.

Your uncontrolled intersection has already had a dozen accidents today, two of which were fatal, yet it's only 4pm. What until the drunks come out after midnight.

As far as enforcement, when a person uses a Cb radio they then agree to all FCC rules, one of which states:

(a) If an authorized FCC representative requests to inspect your CB station, you must make your CB station and records available for inspection.
(b) A CB station includes all of the radio equipment you use.

Sec. 95.426 (CB Rule 26)

No, I meant exactly what I said.

The only method that is precise enough is to use time delays.

Each measurement provides a radius on which the object can be located.
But two measurements are not enough - as two intersecting circles will
have two points where they cross. Three measurements are required to
provide a direction. Four measurements will provide an altitude (if
such is desired) as well.

The normal connection is to an exciter with a relay circuit that is
normally open - eg, it closes to transmit. Open to transmit is possible.

Yes, it has tuned input.

The 572B is a triode, so the choice of manufacturer is not overly
critical. However, if you change tube brands, you may have to realign
the input coils. The realignment is simple, the directions are in the
manual.

>But it's not how the ELT location system works.
An ELT just transmits an AM signal on 121.5MHz or 243MHz

I have apent too many hours in Cessnas and Pipers
at tree tops in the mountains for C.A.P. not to know
how the system works.

>Ultimately, you're trying to establish a *position* for the transmitter.
Yes -

>You can do this by taking angular bearings from several locations, and
>then see where the bearing lines cross. That's how much land-based
>radio direction finding works.
So -

>You can find a position by measuring absolute distance from a set of
>ground stations using the time it takes radio signals to propagate
>from one to the other. Once you know the distance from each ground
>station to the target, you can draw a circle of that radius around
>the location of each station and see where the circles intersect.
>Simple in principle, but requires precise time sync between transmitter
>and receiver.
Not for ELTs
Not satellites
Not CBs

>In practice, this is actually done by measuring the *difference* in
>time of arrival, not absolute time of arrival, of radio signals.
>For any two fixed stations, a third station that sees a given time
>offset between signals from those two stations must be somewhere on
>a hyperbola of constant time offset. Use 3 or more stations in

>pairs, and you get 2 or 3 of these lines, and the intersection tells
>you where the unknown station is. This is how LORAN works, and GPS
>is very similar.
Not ELTs
Not CBs
Not satellites

>But the ELT-finding system uses non of these methods. It uses the
>moving satellite and a ground receiver to measure Doppler shift of
>the ELT transmitter.
Yes

>For a given instant in time, the locations on
>the ground that can have a particular Doppler shift as seen by
>the satellite forms a particular line along the ground. But as the
>satellite moves, the Doppler shift changes, and the shape of the
>line on the ground with that particular Doppler shift also moves.
>There will be only one point on the ground that gives the *particular*
>pattern of change in Doppler shift seen from one or two continuous
>satellite passes.
Even more important - that absolute delta in signal
when the satellite changes position from the transmitter
being "header of" to being "behind" the satellite.
At that instant - the transmitter on the ground is
"in line" with the satellite. Since the position of the
satellite is known - the DIRECTION is known.

>
>So the system can establish a position on the ground, without ever
>having the ability to take a directional fix at any instant in time.
The satellite just has a transponder on board -
rebroadcasting the ELT (or whatever) signal.

>In fact, the satellite doesn't even have any measuring equipment
>on it - all it does is receive the signal at one frequency,
>translate it to another frequency and retransmit it. All the measuring
>electronics and computation hardware is on the ground.
So what?

I said
"Don't you really mean - because they "do" take
a directional fix... After all - without a direction
component - you can not resolve a direction.
Since a direction IS resolved from the satellite
then - ergo - there must be a direction component.
And with two direction components - you have
a fix. Simple idea - Simple math - simple system - "

I said they take a directional fix -
You agree don't you?

I stated a direction IS RESOLVED from the satellite.
You agree don't you?

Why are you arguing with me?
In order to get a directional fix - your
measurement must have a direction component.

> Dave

Dave - I believe we are in violent agreement.
I naver said that the satellite had a 1940s
vintage loop antenna and some servo
wildly turned the loop to get a direction
did I?

Gil

Um, not always true, Dave, depends on what news reader one is using
and what options one is using. Went through this a few weeks ago with
Velek over a "NT" [no text] post that didn't tie to anything.

Forte Agent allows sorting of incoming group by thread, subject,
author, date or size, and most don't show the tree structure.

>
>He also had many opponents, who were to scared to say anything!

1==> What percentage is "many", and how could it be proved? When
things were going well, he certainly had plenty of support. After the
war was lost it would have been hard to find many who would have
admitted being supporters.

>> For the most part Hitler, like Clinton, tried to appeal to the
>> establishment moderates of his society.
>
>No he did not. He tried to appeal to the nationalistic thugs, not the
>moderates!

2==> Sorry, but he seems to have had great support from most of the
population.
>
>> His propagandists even were trying to make him out a savior (their
>> were paintings of him looking like Christ).
>
>Many believed he was at first, however they quickly figured out the
>truth!

3==> Well, as far as anyone can tell, the overwhelming majority of the
German population supported Hitler. We can only judge by what they
said and did. There is, of course, no way to tell what anyone
actually thinks.

During the inquisition, I suppose that the RCC had a lot of support
too. If anyone had any reservations most kept quiet about them.
>>

>> : > In truth, Hitler was a step from what they had experienced

>
>The Weimar Republic was not "very socialist". It would be fair to call
>it left wing, but not to the degree you are suggesting. The government
>was hated by the extreme left.

4==> Am pretty doubtful that it could even call it particularly left
wing, but this, of course, can be hard to define. A lot of Americans
thought that President Franklin D. Roosevelt and his "new deal" were
both very "left wing".

Many Americans today think that universal medical care is a "left wing
socialist plot". According to 1999 World Almanac, in 1997 over 43
million Americans are not covered by health insurance.
>
>> And very restrictive.
>
>Nothing compared to the restrictions under Hitler!

5==> Depends on who you were. Certainly there were increasingly
severe restrictions on Jews, but the average German didn't seem to
feel very restricted.
>
>> Hitler was actually considered to be liberating.
>
>For a short time, until people figured out what he was really like!

6==> Um, what percentage of the people and when? ...Again, we cannot
get inside people's head to find out what they really think, but he
certainly seemed to have plenty of support. ...Of course, when ones
children belong to the Hitler Youth and report any deviation to the
Gestapo, one would keep ones opinions to oneself.

>>
>> : > Germany, even today, is a society that is very homogenous.
>> :
>> : Not really, Germany is changing just like everywhere else. With so many
>> : "gastarbeiter" it is impossible for Germany to remain homogenous.
>>

It isn't a perfect world, and no matter what the system there will
always be some mistakes. The only way to eliminate the extremely
small percentage of mistaken raids is to eliminate all raids.

I somehow doubt that American or Australian or British cops go around
kicking in doors on a whim.

>Bill Nelson (billn@peak.org)

Hi Bill -
HOw can you justify that statement
when the equipment being tracked
does not have a means of providing
any feedback?

A time measurement depends upon knowing when
the signal is transmitted.

An ELT (or CB if we are still in that box)
is a transmitter that is not coupled into
the system. Unlike a DME or GPS or radar transponder,
the transmitter is just sending a signal.
Any other station has no clue of the
timing or phase lag or anything
else regarding the signal. If received
from a satellite - the dopler shift of

the satellite's receiver (with respect
to the transmitter on the ground) can
be measured by an analysis of the satellite's
rebroadcast of the signal.

A time delay measurement would require
the analysis of the transponder signal
to have knowledge of the actual time of transmission.
This is information you don't have from an ELT
(or CB, or ...)

Where you getting this data?

Best regards
Gil

The firestik was not made to be used with the magmount. This does not mean that it cant but the antenna will have to be tuned some. The magmount can make the antenna electrically shorter than it actually is.Put a 6 inch spring on the bottom of the Firstik and see if this helps. If the SWR improves you are going in the right direction.

Of course there is another option, get an Amateur License and have the ability to use repeater systems anywhere in the country for free. Overkill for what he wants I know but once you have the License its good for life and doesn't cost anything other then for the radios. Static Free, no trash talk and on average 50 mile range with a Handheld radio through a repeater.

Also Firstiks were made to work with an 18 ft lenght of coax?I haven't messed with a Firstik in a while They used to like to refer to there antennas as 5/8ths, do they still do this?.I guess technically speaking they are. Instead of loading a short antenna to 1/4 wavelength they load it to 3/4. This results in an antenna they can technically call a 5/8ths or 3/4 but is worse than a loaded 1/4 wl of the same physical length.

>
>>I stated a direction IS RESOLVED from the satellite.
>>You agree don't you?
>
>A position is resolved, and a direction can be calculated.
>This process takes examining the signal over time.
Buzzz - wrong .

Nope - only one point - where the dopler transitions
as the satellite passes from being behind to ahead
of the transmitter.

The only examination "over time" is to listen
to the signal for the instantaneous shift that occurs
at the point the satellite is in line. That point does
form the direction. The transmitter is exactly
below or abeam of the path of the satellite.

>That's different from "taking a directional fix".
That is a direction in its purest form.

No one's shrugging off a sad anomoly such as that. But take
the number of such events, divide by 248 million, multiply
by 100, and toss a percent sign on the end. When such events
become greater than 0.0000001%, then it's time to panic.

I have recently just purchased a Blackcat Modulator.
I thought it was a JB-12, but on the back it says it is a model JB-150.
Also I used to have a JB-12 and remember it being a single 6BQ5 tube amp.
This has 1 6AQ5 and 1 6BQ5.
I dont know if it is 1 driving the other or what the purpose of the 6AQ5 is.
I am looking for some information on this amp.
Thanx for any help.

I conducted a straw-poll vote more than a year ago regarding FA posts;
of those who responded, the votes were about equally split for/against.
So I added a note to the rec.radio.swap FAQ reminding readers, that
because FA posts are a sensitive topic, to please append "FA" in the
subject line so as to avoid flame wars.

Good radio procedures are not strict rules. I hear courteous radio operations every day.. of course that is out the US 40 CB channels.

>I think you are way out of line saying how stupid skip
>shooting is on channel 6, 11, or 26 and you are in no position to challenge.

Shooting skip? Is that what they do on the toilet bowl? I thought it was a bunch of incoherent talk where the operators just laugh and repeat themselves over and over again. At least that's what it sounds like.

587. FS: 3 swr/pwr meters

Newsgroup: rec.radio.cb
Date: 2000-04-05 00:00:00 UTC
From: kg4fet@aol.com
Message-ID: <20000405082111.21142.00001035@ng-fn1.aol.com>
Source record: 30037

I have for sale 3 swr pwr meters.
1. Dosy PM-1000-TS. Reads power in 3 scales 30-300-100. SWR and modulation meters as well. Modulation still works GREAT! Meter is in excellent condition. 40.00 + shipping
2. Galaxy FC-100. Among the features on this meter are FM deveation, Feild strength meter, SWR, Freq counter and pwr. Although the power is only to 100 watts this meter is an excellent addition to any station. It can be used between your radio and amp (if you have one) or as a stand alone bleed off Freq counter. I have all documentaion, parts and the box for this excellent little meter and it is in new condition. It would be a fantastic addition to any station. Requires 12-14 volts to run the Freq Counter. 50.00 + shipping
3. Radio Shack digital swr/pwr meter. This is in great condition reads pwr in 4 scales 20-200-200. It has a remote hook up and comes with a wall transformer for the base and a cig plug for the car. SWR is read automatically. I have the documentation (on line copy) and it is fully operational. 40.00 + shipping.
Thanks for the read,
Sandor KG4FET
I woud consider trades for a HF/UHF/VHF swr power meter.

Usually on older tube-type amps, the 6AQ5 tube is used as a RF keying
sensor switch. You are probably looking at only the 6BQ5 as an amplifier
stage.

Darla & Buckwheat
those little rascals

Buckwheat and Darla were in school, and the teacher asks Darla:

"How do you spell 'dumb'?"

Darla says, "d-u-m-b, dumb."

The teacher says, "Very good, now use it in a sentence."

She says, "Buckwheat is dumb."

The teacher says, "Now spell 'stupid.'"

Darla says, "S-t-u-p-i-d, stupid."

The teacher says, "Very good, now use it in a sentence."

Darla says, "Buckwheat is stupid."

When the teacher calls on Buckwheat and says, "Buckwheat, spell
dictate."

Buckwheat stands and says, "D-i-c-t-a-t-e, dictate."

The teacher says, "Very good, now use it in a sentence."

Buckwheat ponders for a few seconds, then spurts out,
"I may be dumb and I may be stupid, but Darla says my dictate good!"

Dr. Smith's Advice

A flat-chested young lady goes to Dr. Smith for advice about enlarging her
breasts. He tells her, "Every day when you get out of the shower, rub the
tip of your breasts and say, "Scooby dooby doobies. I want bigger
boobies."

She did this every day faithfully and after several months, it worked!
She grew great boobs!

One morning she was running late and she was on the bus when she
realized
she had forgotten her morning ritual. At this point she loved her new
boobs and didn't want to lose them, so right in the middle of the
bus--"Scooby dooby doobies. I want bigger boobies."

A guy sitting nearby asked her, "Do you go to Dr. Smith by any chance?"

"Why, yes, I do. How did you know?"

"Hickory dickory dock."

A dentist was getting ready to clean an elderly lady's teeth. He noticed that she was a little nervous, so he began to tell her a story as he was putting on his surgical gloves...

"Do you know how they make these rubber gloves?"

She said, "No?"

"Well,," he spoofed, "down in Mexico they have this big building set up with a large tank of latex, and the workers are all picked according to hand size. Each individual walks up to the tank, dips their hands in, and then walk around for a bit while the latex sets up and dries right onto their hands! Then they peel off the gloves and throw them into the big 'Finished Goods Crate' and start the process all over again."

And she didn't laugh a bit!!! Five minutes later, during the procedure, he had to stop cleaning her teeth because she burst out laughing.

The old woman blushed and exclaimed,

"I just suddenly thought about how they must make condoms!"

AM-only CBs run the transmit audio through one of the
audio output transformer windings. The winding acts
like an autotransformer. In other words, running the
TX audio through the transformer winding amplifies it.

You have to understand that it's the TX audio waveform
that modulates the carrier (and limits the peak power).
In other words, the more you can swing the TX audio
waveform's voltage the more peak power you'll see.

The stock final is a 12 RMS watt device. It can
safely handle the 35 PEP watt peaks that are common
when a 29 is tuned up. The typical RMS wattage from
a tuned up 29 is never more than 9 unless the more
advanced mods are performed. The advanced mods
include changing to the heavier final transistor.

A typical 29 that undergoes a simple tune up will
key at about 6.5 watts and swing up to a maximum
of about 35 peak watts. The fully modulated RMS
(or average) wattage is around 8 or so. The stock
final transistor can handle that as long as it
doesn't have to handle alot of reflected power too.
The higher the SWR that the radio sees, the higher
the level of reflected power. That's why it's
not uncommon for tuned up 29s to blow final tran-
sistors. The bad final can usually be linked to
an antenna problem or a problem with the input
circuit of the amplifier that the 29 feeds.

The confusion you may be experiencing might be due
to an incorrect understanding of the relationships
between RMS, average, PEP, and peak wattages. The
AM Tutorial on my website is useful at clearing
all of that up. Feel free to read it if you're
interested. The address to my site is below.

> better than understandable.

Unbiased CB amps are closer to Class B (which is
still linear) than they are to what is trully
considered Class C (where a NEGATIVE bias voltage
is applied to the transistor bases). That's why
unbiased CB amps produce a useable (readable)
SSB signal.

There is some gray area within the amplifier Class
definitions. Unbiased CB amps fall into one of
those gray areas. By the strict definition, they
are Class C amps. But, in practice, they operate
very much like a Class B amp. You could say they
are just to the Class C side of Class B. A trully
Class C amp would not produce a useable signal on
SSB.

I'm currently in San Angelo looking to add a CB/Antenna to my Jeep (TJ).
I'm willing to drive and perhaps make a weekend out of it, but I want to
make sure that the installer knows his game and I won't have any regrets.
So If there's anyone out there who knows of a great shop (chain, diamond in
the rough what ever) please let me know.

608. Base radio and mobile amp F.S.

Newsgroup: rec.radio.cb
Date: 2000-04-05 00:00:00 UTC
From: MrEvo <MrEvo@mailexcite.com>
Message-ID: <38EBE482.7E5A5CDA@mailexcite.com>
Source record: 30108

I have a tricked out Cobra 2010WX and a CTE Systems mobile amp to sell.
THe radio is very clean,has freq. counter,swr/modulation meter built in.

Also has a clock.
The radio covers 26.325-28.045.
The coarse clarifer moves up and down 12kc and the fine clarifer moves
up and down 3kc
It has variable power and a external amplifier keying cable.
$250
The amp puts out 150W,has a switch for power,am/fm/ssb,and it will
operate class AB or C.
$75
All prices are plus shipping.
Email with questions.
I am looking for a 300+ watt mobile amp,I would consider trades on a
either of these 2 pieces.
73
Mr.Evo

Pretty convincing -- for a Uniden sales representative <grin> just joking!

Really, I've had CB's for 20 years, Soundtracker works fine. I have the HH45WXST and have none of the side effects Double Trouble describes.

I agree with DT that if you want to hear it all, you turn off the Soundtracker (you can do that -- it's a push of the ST Button) and turn the squelch all the way down, and you'll be in CB heaven... noise and all! I enjoy that too sometimes.

But for just plain old CB fun, Soundtracker is really cool.

GREAT message! But living here in SEVERE Upstate New York (30 miles south of Canada) I do get two Canadian T.V. stations. Both stations, thru their news/programming label us as 'gun-slingers', and often refer to U.S. policy as the 'Dumbing Down' of Canadian policy. They ACTUALLY consider us as being BELOW Canadians!! I guess we are geographically, but they often consider themselves as being 'better' than us Americans. For non-believers of my testimony, feel-free to tune in to CKWS or CJOH.. That's your assignment for today.

Hi all

I posted this question to a respected tech, but got no answer on this. Thought some of you who do work on radios might know about the feasibility of the following mod for my RG99 (and every other import radio that has echo).

Seems to me that the echo effect we have is what would be referred to as a 'delay' effect by recording engineers. What I think sounds much smoother is a real 'reverb' effect. Currently our effect would like yelling HELLO and hearing HEllo, Hello, hello (repeat as long as you like).

The effect I'm after would be more like when you're standing in a room with hard walls (like a big bathroom, or empty gymnasium). You say "Hello" and it takes a second for the sound to die down, but there is no clear echo of your voice. You hear this effect all the time when you watch just about any live show on TV. Particularly popular with the TV preachers as it gives them a little more god like sound.

My guess is that there is a chip in my radio whose sole job is to do the echo. Also I'd guess that the manufacturer of that chip has others with the same pinout that do different effects. Anybody know if this is true? Or if you don't know that, do you know the make an model of the DSP chip that does the echo? I can root around and see if I can't find a straight replacement.

Another neat sound is what is called 'chorus'. This uses a delay just like we have now, but it shifts the echoed note up and down slightly to make an effect of two people talking at the same time. Lots of singers like to use this as it smooths out their voice and makes it sound a bit more musical.

Any of you guys know about this stuff? I think that most effects we hear are generally annoying, but a good reverb or chorus should sound good but still be fairly subtle.

A different take on this would be to modify a mike cord that lets you plug in any electric guitar effects pedal and use the nice 16 bit effects those have.

-Milkman Mo (formerly Postman Pete, formerly Hangover Hank)

Milkman Mo,
What I can't understand is why you would want to
distort your audio like that. Is it because there's no
'content' and you have to have something to draw
attention?

Truedat,
Hust depends on what your 'pre-tuned' antenna is
tuned for. Ideally, changing the length of the feed
line should make no difference in how the antenna
behaves. But, some people do use a particular length
of feed line to 'fool' the radio into 'seeing' a nice
load (antenna). Changing the length of the coax may
or may not affect things. Only way to know is to try
it.

Hello Don: Yeah what Hillbilly Dave says!

I'd go with the Shakespeare ABS 1600, if forced to go with the fiberglass antennas. Its easy to install on a Push-up mast, and doesn't have a lot of wind resistance.

But the metal 5/8 wavelength ground plane antennas are better. I have measured the difference in field tests against calibrated (in dB's) receivers.

Jay in the Great Mojave Desert, just down the road ah ways from the fillin station.

Don't, Please.... The computer supply is a switching supply, not a linear one. Even though it might be fine, if it fails it is capable of sending high voltage to the radio by nature of the way it works.

there was a kit that did similar to what your looking for if you could still find one. i bought one quite a few years ago from copper for about $100. it was a amp that replaced the heatsink on 2950's and was supposed to do 100watts pep. i never installed mine on a 2950 because i'm almost positive they had heat dissipation problems because there was almost no heatsink on the external unit. they could be made to work with more than just the 2950 though.

Tim,
Interesting. Only comment is that if the trees
were affecting one antenna, and the second antenna
was 'close' to where the first was, it was being
affected in the same manner. A particulat 'type'
antenna is not immune to surrounding objects.

Beedman007,
A computer power supply does provide 12 volts DC,
but at a fairly low amperage. I doubt if it would
power a radio while transmitting. If you have one,
theres nothing stoping you from trying it. If you don't
have one, don't waste your money.

Such childish, immature acting. Reminds me of my 2 year old cousin. Oh well.
Some people never grow up.

To put it to rest...

Peek, the early Messengers didn't have the adjustables on each pair... Howe
ver, we did have a separate diode clamp on each pair of transistors.

The amps of yesteryear that did have separate bias where Commanders, Hy-Rang
e, Rangemaster, Palomar DX series (the 200, 250 and 300A solid state amps) a
s well as others.

Having separate bias controls means you DON'T have to match transistors as w
ell as in a circuit that has multiple pairs.

That is another reason that people don't have to order matched FETs... Usua
lly a FET amp has, standard, separate bias supplys for the gates of EACH tra
nsistor.....

TollHolio has spoken......

:)

I am looking into a cb with ssb and a frequency counter + pa.
So far I found.

Galaxy DX-959,
TR-696F Texas Ranger,
TR-396F Texas Ranger,
Midland 79-290 with no pa.

I am not very electronically inclined so I will not modify it.
I don't want to get anything illegal either.

Are there others?
Which one is best?

Don

Hi all,
So far I have my cb choice down to The Cobra25 WX ST and the K 40 CB. I like the idea that the Cobra has a weather band. Does anybody have any experience with these two radios. Do you like one over the other. I am really having trouble deciding.
Thanks everyone,
R.P.

Even without peak reading watt meters, 18 watts was reasonable. When you remove the rectifier tube and replace it with a solid state device (diodes), the output of 18 watts doesn't place any more strain on the circuit than 5 watts via the hollow state rectifier device. The Messenger series also had a business band unit with the same chassis design. Business Band rigs were allowed higher output, so the CB counterpart with the same chassis had a lot of room for performance to be restored to the level the circuit was designed to produce.

I have to agree with Bill's assessment of peak reading measurements. By the book, 1.414 should be the multiplier, but the actual meter circuit doesn't adhere to this RMS to Peak formula. Conversely, Peak to RMS should result in a multiplication factor of .707.

David

When you key up or put a Cb radio into transmitt mode a voltage is sent through the units coaxial output via the coax cable to the antenna where it is converted into a ' Carrier Wave ' , this is the magic carpet or platform that your voice or ' Modulation ' rides on as it propagates. Yes...the louder the modulation the better, as long as its clean and not too distorted.

I've used a computer supply for a car stereo once. Without enough load on the supply, it would get unstable and start squealing. I had to turn it off and back on to reset it. I took a old ST-225 and hooked it up and never had that problem again. Just had to turn up the stereo to drown out the Seagate! Old IBM AT's had a large resistor that was hooked to the PS if you had no hard drive.

yes, you can put a small amp in your radio. it's a stinger board. you use your finals as the driver 4 watts. you have to take out your speaker. and mounts in it's place. uses 1 sd-1446 transistor 75 watts pep.
comes with a on/off switch
i have about 20 on hand

I have a Silver Eagle forsale. Excellent Condition!!! It's real LOUD!!!!!! I hate to let it go. Has a 5-pin plug for a Uniden Washington. Just put a 9volt battery in it and blow'em away!!!!! If you get this mic, you will not want another mic! This mic is awesome!!!!! Everyone that I talk to here in Georgia is always jealous of how loud i am. Wish i could keep it. Email for pic or any questions.

$70 bucks

You have to modify the DX55V.
Try the Cobra 148GTL- F. It has the same features as the regular 148GTL,
but with a freq. counter. Very nice radio.

700. For SWAP: NICE Sparkomatic 40 ch. base model 5100 with digital clock

Newsgroup: rec.radio.cb
Date: 2000-04-06 00:00:00 UTC
From: rockjammer@aol.com

Source record: 30138

Hello. I have a Very nice Sparkomatic Model CB5100 digital base for swap. It is 40 channel AM only. I obtained this with a problem. Ended up the PLL circuit was out of alignment is all. I aligned the entire rig. Works terrific. My peak meter to a dummy load shows 3 watts out carrier and 15 when speaking. Nice sensitive receiver. Shiny brushed aluminum front panel in excellent condition, dual meters, one for Modulation and one for Power out, recieved signal strength and SWR. Antenna warning light, recieve light and transmit light. All lamps and meters are illuminated red...pretty. Nice large digital channel display. Has Nice big digital clock that works perfect along with what they call "Auto Watch". I believe this is a timer circuit. I tried it and the rig powered up all by itself when the correct time set was reached. Has adjustable tone control, volume, squelch, SWR cal, fine tune knobs. Has 5 switches and 5 buttons, all nice aluminum for clock, etc programming. Has Large 2 inch diameter chromed tuning knob with ridged rubber insert..nice. Has two large aluminum handles on the front for carrying, one protruding from each side at the front. This is a big radio measuring 12" deep x 6" tall x 16" wide. Woodgrain cabinet on top and sides which is in quite good shape. Internal construction is definately above the norm here with quality multiple circuit boards.Front spacing internal speaker. A Very pretty radio! Comes with a hand mic I wired up for it. Nothing fancy but sounds great. All solid state of course. Never knew Sparkomatic made anything this nice. At this time I have been unable to figure out where I put the paperwork for it.
I would like to swap for about anything amateur radio related or possibly a decent scanner. Just not into cb that much anymore. Let me know if you have something that might interest me. I would include my Paradynamics 6" wide scale peak reading power meter, swr bridge, modulation meter in like new shape with box for right deal. Thanks for your time. Feel free to check my Ebay feedback.

With the quality of coax today, the' multiple of 12 ft. rule' is no longer valid. In my mobile, I have about 11 feet of RG8-X and a 3ft. jumper for a V.S.W.R. of about 1.2:1. On my base, I have about 83 ft. of coax for a V.S.W.R. of approx. 1.1:1 Actually, I cut my mobile coax to an EXACT fit, disregarding any 'proper' cable lengths. Worked fine for me! Oh I'm sure some folks' will tell you that you need 8.375425900 ft. for a "perfect" match! HOCKEYPUC!

Message-ID: <3iVG4.5313$Vb6.208306@newsread2.prod.itd.earthlink.net>
Source record: 30146

Hi, I am a CB Newbie, but my police explorer friend conviced me to get one ;), so I ended up buying a Cobra 19 Ultra 2!, and I bought a back windshield mount, so My antenna goes in the top middle of my windshield. Anyways I can't seem to get any reception? He said he installed the Cobra on my Cigerette lighter fuse, because my radio fuse was already being used by my speaker, so is that the reason I am not going any distance with this CB? I cannot even hear truckers when I am right beside the interstate, going into the interstate, and it shifts on and off when on the interstate, I know their not done with their conversations!, Got my squelch almost to Minium, he mentioned maybe I should run a line direct from my battery to the CB, am I just got a crappy CB or could somebody help me out there? Thanks

I am a rank amateur who wishes to fit a cb radio to my motorbike. Can anyone help? Also, can anyone point me to a web site that can explain the basic differences between AM, AMSSB and UHF?
I need to be able to fit mike and earphones to my helmet and be able to press a button on the handle bars to transmit. Sorry if this is a bit basic. Could you reply to my email direct, please? terry@lis.net.au

Whatever... thats what I got to say to about 90% of the people in here.. there are that select few that are not only tolerable but... well.. I suppose it is most of the "quiet" ones, that I will actually agree with....

This post of mine was made AFTER he made the statement that I was acting like his "dad," after simply asking him to use the commonailty of "FS:" without the quotes that is. Read back, you'll see it.. assuming the damn servers stamped the messages correctly, even if they didnt the time and date on the servers shouldnt have changed......

Its a dropped subject anyway.. I asked him nicely, he didnt care for that, so I attacked to see if he would take the bite... he did.. hooked and reeled in.... ended up being a big ugly boot instead of a beautiful trout... oh well...

How do you decieve or dodge love. You better check out "love" in the dictionary. hell check out "missing" why you are there than maybe you will understand what the children go through.
http://www.m-w.com/dictionary.htm

"ruse" You are half goofy obviously you have never had a child. if you have you never loved it. In fact I don't think you ever loved anything in your life.

You don't know me. "Worthless do nothing existance" What makes you think that? I do stuff all day I am my own boss. I pay myself when I want to get paid. I pay what I need to. I think I will take next week off. What do you think about that. Hell I just paid my internet provider for a year. I get what I need to live fairley comfortably. If the boys were here they would be happy as they were
pre exparte.

The meal ticket thing is not the answer if you think welfare people are getting rich you are sadly mistaken. I had to do that once and it is a degrading thing to go through. $426.00 and food stamps of $300.00. It is a tough existance I would not go through that again. Could you live on that?

IMO you have your own "human debris" thing going on.

Humanity thats a joke you tell me what is humaine about taking children from their parents like you take puppys from dogs and justify it like there is no trauma to the child. Bullshit!!

You should concider bettering your skills at playing with shotguns especially if you are a socialworker, service provider or a judge that believes the bullshit handed to them!!

What I do I do for you my little buddies. I love and miss you.

The main difference between echo and reverb is the amount of delay and decay. I used to have a kit made box that would give you either effect just by tweaking a couple of pots. It also gave phasing and phlanging effects.

That would give you a location at least 20 miles across, and probably
far more. There is a fairly large period of time where the shift would
be unmeasurable, especially if the satellite was traveling overhead.

You are leaning toward ambient recovery on this effect. To get an idea of
what you can recover, try adding third speaker to a stereo receiver
connected to the right and left "Audio Hot:" terminals (no grounds). You
have the basis of the "Vocal Zapper" type effect where only the sounds
recorded out of phase from the main track are played thru the third speaker.
You would need some kind of circuit to enhance the out of phase "partials"
of the mic inut, and most communications mics have such sharp rolloff above
midrange that ambience is unlikely to be passed to the audio amp for the mic
circuit.

It used to be the SA1024 "Bucket Brigade" delay chip. There are porobably
a bunch of better solutions available today with digital processing.
However, digital is much less full in sound compared to analog based
effects.

> Another neat sound is what is called 'chorus'. This uses a delay just

You will probably have to get an inexpensive mixing system with loop-thru capabilities to allow the addition of Chours or effectron type effects. The mixer also will give the chance to tailor the audio tonal characteristics and add tremelo or echo, depending on the feature level it offers. In days gone by, I modded Realistic 32-1110 Electronic Reverb units for Mic input for am CB Use for the locals. The reverb unit offered 20 to 20KHz response, +20 dB mic gain with delay time of 5 msec. to 95 msec, echo time of more than 1 second. S/N ratio varied from 65 to 41 dB. It offered slide controls for mic gain, delay, repeat and depth. The mod consisted of adding a 4 pin mic jack in place of the 1.4" jack, ading a 1K resistor in line with the power lead to allow 12VDC source as opposed to the 9v battery and a 1N4730 diode from the circit common ground to the neg power lead for the 12v minus input to give basic reverse polarity protection. Xmit/Receive mic wires went straight thru from mic input jack on reverb to radio mic input, with audio process thru the reverb. Quite impressive sound in the mid 80's.

Externally provided effects would be the way to go if you are out to achieve "broadcast quality" response and outcome. Listen to some of the AM hams on 160 meters to get an idea of what broadcast wuality AM transmissions can sound like. You would be amazed.

Have Fun,

David

Hello Al: The window mounted CB antennas are the worst in the world, OK
for cellular phones, but for CB frequencies.

Get a magnetic mount or trunk mount, they work a 100 times better.

Yeah when you use a Cigarette lighter the power will go on and off when
your plugged into the lighter. Its not really made for permeate
installations. Wire the radio straight to the battery, and you will half
to remember to turn it off when your done driving. Good luck.

Jay at jay123a@qnet.com ..... In the Great Mojave Desert, just down
the road ah ways from the fillin station.

I'll bet he has more problems thAn the antenna.....he should be able to hear a trucker when he's beside them without an antenna... but thats a good place to start. perhaps his coax is shorted out. that would ground any sigs and cause what he is discribing...

food for thought

dave

I had one of those - it was great! I made an adaptor for it,
to go between the mic and the rig.

Four AA batteries, black thing with four faders, yes?

No repeat, small delay, halfway depth gave a good extra
"presence" I found.

It was fun changing the delay while there was an echo going on!

Sigh, happy memories!

for sale; super clean Uniden Pro-710e 40 channel CB base station - this
is an AM only model, it is a really nice looking all black base station,
looking much like a piece of professional equipment. This one shows
very little use, would make a great second unit if you don't mind no SSB
original box is present but pretty wrecked, i am going to throw it away.
Owners manual, original mic are present.
$40.00 + actual shipping charges
please email replies, tnx in advance

BB runs foxie boxes only for dc sky. He primarily runs x-force otherwise. Secondly, for those who dont know, 123 is long gone from x-force. that would probably be why their sales is up, along with customer satisfaction. I'm sure after all the mowatts shit going on you could understand why 123 being gone would want to be stressed!!!!

A typical 200 Watt computer supply will supply 7.5 amps, a 230 Watt one will supply about 10 amps. More than enough for a CB. Black is ground, yellow is +12 volts.

I don't know who wrote this, but Byron McGregor of the long gone CKLW in Windsor, recorded this in the early 70's. They played it all the time. Sounded great on the Detroit airwaves. It's good to see it resurface again. If you can find this early recorded version, give it a listen, it sounds even better than it looks!

Gordon Sinclair (news commentator at CFRB/Toronto) also recorded a version of this. The two versions were on the Top 40 at the same time and were both given radio airplay in the late winter-early spring of 1974. It was called "The Americans."

From: Lowanse <cat88@helicon.net>
Message-ID: <seq5blaprfg184@corp.supernews.com>
Source record: 30243

hi , what is the proper connection, from radio to amp, radio has a band data
8 pin , mini din jack in back of 840
1.+13.5 volts
2.tx ground
3.ground
4.band data a
5.band data b
6.band data c
7.band data d
8. linear

the 2100b has 4 screw conditions on rear
1. e
2. alc
3.e
4.relay

I bought a frb-757 relay box that plugs into the band data in rear of radio,
there is also a ext. alc rca phono jack in rear of 840.

any help on this would be greatly appreciated.....

Yaesu said years ago that 30 to 40 percent of their HF radios went to
other that ham customers. Probably no call sign on the orders. So this
is a good place to sell it.

Hay CD your slip is showing.......

> kind of load.

Alot of the big number claims you hear these days
are the result of the switch from using average-
reading power meters to the use of peak-reading
power meters. Using a peak-reading meter increases
the measurement anywhere from 2 to 4 times what
an average-reading meter would say. A stock, 4
watt AM-only CB will read 16 watts (when fully
modulated) on an accurate peak-reading meter.
Simply removing the modulation limiting transistor
will make that jump up to 25 or more in many cases.

So, the first thing to do when you hear a big
number claim is to divide it by 4. That will
usually bring it back down to something that's
believable. For example, the claim that the
Johnson does 30 watts is much more in line with
reality when you figure that the 30 is a peak
reading and that the radio's average power
(average being the old and most correct way to
rate an AM transmitter) is really 7.5 watts
(30 divided by 4).

Sounds like an SB-200.

Ham amps have their problems too. While
it's true that their tubes are cheaper to
buy, you still have to deal with the fact
that ham amps don't have RF-sensing keying
circuits or driver stages, and are not very
efficient on 110 volts or at CB frequencies.
It's not like they never fail (require repair)
either.

Well I see, pay yourself when you want huh. Oh and paid your ISP (cis.net in Clinton Ia.) for a whole year too. Wow this is interesting. Hey I wonder what it is you do for a living? Wait I know! I'll just look up some of the names that were in that moronic post you made in the alt.adoption group in the phone directory for clinton. Maybe they can tell me what you do.

Geez you almost had me! Seems most of those people you listed as "Contacts" don't have phones just like you don't. But there was one gem! With a little social engineering she was more than willing to spill her guts about your miserable existence to someone she thought was one of your favorite people! A "Case Worker".

You want facts I'll give you FACTS Your about 5'8" 350 Lbs, brown, and brown. You haven't had a job for much more than a week straight for years. Your "self employment" consists of doing odd jobs that your CB buddies throw you a few dollars for. You do not have a ISP you use the computer and account that belong to the people that you live and mooch off of. You just got out of jail about a month or so ago (she wouldn't say what for but we can guess). Your DL is revoked.

Oh yea, you'd make a great parent!!!!

I understand that that your fat squat frame makes it impossible to bend over and trim your toe nails. So I would suggest a Mossberg, they have a wider trigger guard than most.

You know I think the wire was small for a ground (10 AWG 80'), but I think it would have really made a difference, even if it did burn up. As far as vaporizing, you are correct, a bigger ground wire would be better!

A young boy had just gotten his driving permit. He asked his father, who was a minister, if they could discuss his use of the car.

His father said to him, "I'll make a deal with you. You bring your grades up, study your bible a little, and get your hair cut, then we will talk about it."

A month later the boy came back and again asked his father if they could discuss his use of the car.

His father said, "Son, I'm real proud of you. You have brought your grades up, you've studied your bible diligently, but you didn't get hair cut!"

The young man waited a moment and replied, "You know dad, I've been thinking about that. You know Samson had long hair, Moses had long hair, Noah had long hair, and even Jesus had long hair."

His father replied, "Yes son, and they walked everywhere they went!"

"Breaker, breaker channel 10 for a smokey report."".....boy how times have changed! In the summer of 1974 I bought my very first CB radio. It was a used Robyn WV-23. I also bought top of the line antennas, factory co-phased Hustlers on gutter mounts. I got a radio check from Virginia and I was in the hills of Kentucky. I didn't have a clue what "talking skip" meant. Within a week I was invited to a local house to see a base station. It was a five-channel Johnson. Not channels 1,2,3, but channels A, B, C, D, E. I was amazed. The CB was now my hobby. I spent hours in my car, day and night, just so I could "ratchet jaw." Later I would learn, quite by accident, exactly what skip was. While babysitting for my sister and her husband in 1977, I was talking on his base station. A lady in Texas, while I was in Florida, said hello and asked me where I was. When I told her, she surprised me by telling me where she was. I was so excited. I didn't know what to do. I wished her well and signed off with my brother-in-law's F.C.C. issued license number. When they returned home, he was, to say the least, adamant in teaching me the do's and don'ts of skip talking. Don't give out your address or "call numbers" while talking skip, (more than 100 miles away). He assured me it was an engraved invitation to Uncle Charlie, the F.C.C.

Soon after I got my Robyn, the CB took a drastic redirection. The truckers moved from channel 10, (where they interfered with channel 9, the emergency CB channel) to channel 19. The 23 channel radio became a thing of the past when the new 40 channel models hit the market. Cobra, Pierce Simpson, Browning, Tram, Teaberry, Radio Shack, J.C. Penney, Sears, and all others were forced to conform to the new F.C.C. regulations.

I used my Robyn for three years before I sold it. I bought a Sears 40 channel mobile and by 1978 I decided I was ready for my own base. A radio friend, (by now the term 'good buddy' is getting old) built a four-element beam for me. Another friend accompanied me to Sears where I bought the biggest mobile they had. It came with a matching power supply so you could use it as a base. I was thrilled. Now I thought I was big time.....

A way to meet all the people I had made friends with on the air was to attend the local CB jamborees. What fun....there were booths set up with equipment for sale, refreshments, contests between clubs (most dressed in club apparel, farthest traveled clubs, first club there, etc.), raffles, dances, and fun. The Top 20 jamboree was held in a different state each year. In 1978 it was held in our area. Being a three-day event, we got rooms at the Holiday Inn and stayed for the duration. It was so much fun meeting people from all over the country that I had talked skip with.

Skip talking was becoming more and more interesting to me. I listened a lot at first, but by the end of 1978 I was getting quite good at talking skip, too. Of course skip talking was illegal, by F.C.C.'s rules. So was using more than four

watts of power, cursing, playing music, dead keying, etc. Some folks don't know it, but it's still illegal. These days the F.C.C. really doesn't have the man power or the interest in policing 11 meters. But, in 1979 they did.

Early one morning that year, the F.C.C. descended upon our town. They would, before the day was over, inspect, fine, and confiscate equipment from 58 of the illegal base stations and one mobile. They would revoke the licenses of two CB shops and close their doors for business, forever. The one mobile that was cited was a female friend of mine. She was sitting by the bayfront shooting skip with 100 watts, completely unaware of what was about to happen. Elsewhere, another friend of mine had just been fined for extra frequencies, (channels we're not supposed to have) in his base station, while still another friend (by now 'good buddy' sounded goofy to us) was having his Phantom 500 amplifier confiscated. I was glad I was at work and not sitting at home. Otherwise, I would have been number 60. Before it was over, there were considerably fewer stations on the air and everyone was quite humble. Some regrouped and reloaded, while others gave up the ship for good. In other parts of the country D&A (formerly Phantom), Browning (makers of the famous Golden Eagle), Tram and their fabulous D201, Dac, Maco (who later recovered) and others were also feeling the heat. The mighty businesses were all leveled in one blow by Uncle Charlie's heavy hand. We would now see the end of an era. It was a scary situation.

It was a very slow recovery for us. After having all the radios, amps, and air space we wanted, we were now reduced to paranoid little mud ducks. All you had to do was mention Uncle Charlie and people ran for cover. There were still a few of us adventurous types who found occasion to use a little extra power, but we knew we weren't out of the woods yet. In 1982, Charlie was still keeping a watchful eye on us. Occasionally they would pay someone a visit just to keep us on our toes.

In 1981 while people were still trying to get over 1979, a new and exciting experience presented itself to 11 meters. The 11 year cycle. It seems that every 11 years, for a full year or more, we can talk all over the world with little or no power. It was amazing. I was still, for the most part, a rookie at skip talking. But, I learned even the most inexperienced operators can talk around the world during this time period. I talked to France, England, Egypt, and South Africa. It was incredible.

As the years went by, so did Charlie's interest in 11 meters. More and more Cbers were turning to ham radio and computers. Satellite and cable TV were more of a concern. Uncle Charlie no longer required Cbers to buy licenses. After all, the F.C.C. could make considerably more money off other media. By 1985 the CB was starting to pick up again. Beams started being raised, amps started warming up, extra frequencies were becoming more and more popular. It looked like the CB would live again.

I had been dodging Charlie for six years by now. I had successfully avoided him while running a Pride DX-300 (a highly sought ceramic tube amplifier built by predominantly disabled personnel) on an eight-element Wilson Shooting Star beam antenna since 1979. In 1985 I bought a used Laser 400 (also made by Wilson) and (because I kept blowing capacitors in my Pride) a Yeasu ham radio amp. I was

getting about 600 watts and was considered one of the loudest stations in Florida. I have to chuckle ....these days 600 watts will barely get you to the next county, let alone another state. Unfortunately, it was fire that confiscated my station, not Uncle Charlie, in April of 1987. The only equipment I had left was the Laser (standing 54 feet tall with the charred coax blowing in the breeze) and incredibly, my rotor control box. At least I wouldn't have to replace the beam. Wilson had sold the design and rights for all their beams to Maco, who were famous for amplifiers and who somehow survived the Bust of '79. The prices of the beams would rise considerably.

I started over with a Cobra 2000 base station. Slowly but surely I bought an amp, a watt meter, extra channels, a D104 microphone, etc., etc., etc.

I had been talking skip on channel 32 since 1978. My beau, being as curious as he was about radio, started surfing the channels. Before long he had made friends (by now 'good buddy' is an insult) on channel six. I was always reluctant to talk there because they had enormous radios. I was sure that everyone there was running a KW, (1000 watts) or better and I didn't think I would be heard. I had a couple of radio friends there, but I was still too timid. I'm over that now.

The longer we talked on channel six, the more we knew and understood The New CB. The old CB jamborees are now called Breaks, or Functions, or Keydowns, or Shoot-Outs. The major yearly breaks are like the old Top 20 jamborees except now they include contests between mobiles. The vehicles line up like race cars and "shoot- out" (also called 'keydown') to a distant station to see who is the loudest. I remember my first linear. It was an Outcom (now Texas Star) 200 and that 200 watts made me one of the loudest mobiles in the county. Now days the big radios are running anywhere from 3,000 to 75,000 watts. The "top of the line" Hustler antennas are practically extinct. Now huge coil antennas and antenna arrays are the way to win contests. And my little Outcom 200 ran fine on my factory alternator. Nowadays a stock alternator is for headlights and turn signals. Two or three or five or six alternators are a normal sight, as are two or three or six antennas in an array on a car or pickup truck. Now A/C boxes are the King of the Hill. Unfortunately, A/C amps emit a dangerous amount of RF and can cause cancer. That's why our club is sticking to Storm Built D/C amps. I lost a good friend in the 80's who constantly had his face in his A/C amp. He developed lymph-node cancer and passed away at the tender age of 26. The folks who talk on channel six in New York lost a friend and technician when he got zapped by an A/C amp. It's not a fluffy hobby anymore. People have invested enormous amounts of money, time, blood, sweat, and tears in the CB. It annoys us to hear a non-CBer ridicule our hobby. To us, it's not just a radio, it's part of life. A lot of people have left CB because of mentally unstable people that have nothing better to do than torment other operators. The only way we can prevent that, since Uncle Charlie will not, is to stay united in our quest to rid the air of people like this. Women and children should be shown some respect as with all humans. Respect yourself and others will respect you.

: Yes...the louder the modulation the better, as long as its clean and not
: too distorted.

Wrong. The carrier frequency is created in the transmitter, which is also where the modulation is applied to that carrier. The modulated signal is then sent through the coax to the antenna.

The antenna radiates this rf energy as an electromagnetic wave - with less than 100% efficiency.

Message-ID: <8cjtc2$6q1$1@tilde.csc.ti.com>
Source record: 30083

People post lots of messages about maximum distance, and it depends on a lot of things. It's like saying if I yell at the top of my lungs, how far will my voice be heard? Depends. Am I yelling in my basement, or on a mountaintop? Do the people I'm yelling at have good hearing, or are they hard of hearing?

Radio is much the same, are you talking about mobile to mobile, or mobile to base? Are you or the other person on a mountaintop or in a valley? There are so many things that change your range.

But for highway use, mobile to mobile, 4 watts with a small antenna, and assuming clear communications (no skip or interference), you can probably communicate with the average trucker for a distance of maybe 2 to 5 miles, maximum of maybe 10 miles. But during the daytime, skip can be loud, and can reduce your range to around a mile or less.

Hi,
I keep reading on this news group about the sound trackers... I just don't see very much favorable comments. Are most of you people unhappy with them. I am thinking about buying one, but don't know what to do.
What I am looking for is.............. compact as can be with a weather band. Any suggestions about what model to get? Or should I stay away from the Sound Trackers all together.

I looked on the web about Uniden cb's especially the PC 76XLW and the PC66XL. It looked good to me, but since I don't have the knowledge that most of you guys have, I don't know what to pick.
Any help would be truly appreciated,
R.P.

Here is a site I found for motorcycle radio accessories.

http://www.radiosound.com/products/two_mile.html

AM (Amplitude Modulation) is the most popular way to communicate over CB, but SSB (Single Side Band) is also used. AM is easier to use, and the radios are cheaper. SSB is more difficult to use and the radios are more expensive. But SSB will give you more range than AM. UHF is a band of frequencies from 300 to 3000Mhz, and that is where the FRS service is located. FRS would be good to use if you want to talk to another biker with FRS. But for talking with truckers and other motorists, you should go with an AM CB.

Even if the amp will be used on CB, I would much rather see an AL-80B than one of the class C splatterboxes that are designed for CB.

Bill Nelson (billn@peak.org) >>

I submit that my conclusions are likely quite accurate.

Ameritron states that it will provide information on the 10 meter mod for the AL-808B to any licensed amateur with proof of license. Based on this information, plus the fact that the originators request was posted to rec.radio.cb, it is logical to conclude that the original poster was someone other than a licensed amateur who intends to use this equipment on CB.

A suggestiong. Get your real email address out of your Outlook Express setup.

Click Tools -> Accounts -> News Tab -> Highlight News Setup -> Properties -> erase, or enter fake email address

Reason being. MANY companies scan the newsgroups for valid email accounts. If they find one, they will SPAM the hell out of you. Just a friendly suggestion.

Being a CB'er and Radio Ham when I got this number I thought
perhaps one of my old CB pals might be interested in it.

The number is CCZ 1010 (Norhtern Ireland Plate) which can be
transferred immediately to a car of any age (with an MOT) in the
UK.

Further details at my site http://go.to/cherished_numbers

Any HyGain CB collectors out there?

I have for sale a beautiful HyGain 9 "one hander" a-m mobile. This is the 40 channel model. Comes with the 16' extension cable, all manuals and paperwork, and it's in the original box. The box is fairly shelf-worn, but the radio is gorgeous and looks like it may have never been used at all. The only bad thing (you KNEW there had to be SOME bad thing, right?) is that the bag of mounting hardware is missing. Not a big deal; it was a bag of screws. This is a rare find in this condition and in the original box. I'm asking $50.00, plus shipping (will ship via your preferred shipper). Will trade for Heathkit, Sonar, or Raytheon CB gear.

Do you have something for sale or trade that you would like to post without having to go back to all the message boards that you posted your ad on to see if you have replies to it?

We have a new Swap-Shop message board that will email you when you get replies to your ad, it will let you search though the ad's with keywords, it will filter out bad language, and it will also let you know what messages are new since the last time that you checked the message board.

We hope that this helps you when it comes to selling your item, looking for something if if you are just needing information or help.

Go to the CB City website at cbcity.com and click on the Swap Shop button in the top left hand corner of the page and it will take you to the new Swap Shop Message board.

Thanks, and I hope to see you there.

Dean

isn't the rule of thum 4xthe peak envelope power and usualy 10watts rms should
be around 18to20pep. also when doing half
way figiure for coax it is freqx18. 18 been
half of 36 a wave lengh.which will give you a different # for diff,freqs
27.1350x18=488
for the formula .488. 27.1850x18=489
see the the diff, i don't know it all but sure
have work for me enjoy 1iwilly

Steven,
Not without more information. Is there any noise at
all? If you remove the antenna, and touch the SO-239,
is there any noise? If 'yes' to the last question, then
suspect a problem with the feed line or antenna. If the
answer was 'no', then suspect a problem with the radio.
Thats really about as far as anyone can 'take' you
with out seeing the radio. Good luck.
'Doc

Yep that response sure helps the guy decide... Anyways I own a 76xl and it
works great. I have owned a Cobra with Sound Tracker and I wasn't the best
but did work. I know that Uniden makes a line of compact radios. The size
of the Uniden 76 is fairly large, I own a Windstar and had to build a box to
put it in between the seats.

Hopes this helps

From: dontownsend <dontownsend@home.com>
Message-ID: <%zrH4.691$EG2.1519@newsfeed.slurp.net>
Source record: 30274

I have two E F Johnson "Personal Messenger" handheld radios Model 242102 with leather cases. They are an 8 out of 10 cosmetically as is without being cleaned up and will clean up into 9 or 10s. One battery still works OK and the other battery will not hold a charge.

These handhelds are the ones with the "Plug in the wall" rechargeable batteries. The units are 1 watt transmitters and have serial numbers 30303 and 30311. Their date of manufacture is 1962.

Please let me know if you have an interest in them or I'd like to hear from you if you know what they are worth.

Thanks,

Don Townsend in Phoenix, AZ

This is being held this weekend in the Blue Ridge mountains near
the MD/PA line in western Maryland. The hams will be working
6 and 2 meters, 70 centimeters, and maybe an HF rig. I'll be
running my normal channels as listed below. Hope to hear 'ya!

Of course it does. But in reality it is reading a voltage, which must be RMS, to make the Bird read accurately. It is a very simple tool and a Watt is a Watt is a Watt. A complex wave form, like a modulated AM carrier, will not read accurately on a Bird model 43 anymore than you can accurately measure the color of your neighbor's new car without seeing it first.

Have a nice day.

Source: http://www.fcc.gov/Bureaus/Enforcement/Orders/2000/da000765.doc

Before the
Federal Communications Commission
Washington, D.C. 20554

In the Matter of)
)
THE TWO WAY SHOP) File No. EB-99-ST-439
220 Columbia Dr. E.)
Kennewick, Washington 99336) NAL/Acct. No. 915ST0007

FORFEITURE ORDER

Adopted: April 6, 2000 Released: April 7, 2000

By the Chief, Enforcement Bureau:

I. INTRODUCTION

1. In this Forfeiture Order ("Order"), we issue a monetary forfeiture in the amount of seven thousand dollars ($7,000) against the Two Way Shop ("Two Way") for willful and repeated violations of Section 302 of the Communications Act of 1934, as amended ("Act"), and Sections 2.803 and 2.815 of the of the Commissionï¿½s Rules ("Rules"). These violations involve Two Wayï¿½s offer for sale of linear amplifiers capable of operation in the 26.965 to 27.405 MHz frequency band.

On July 14, 1999, the Commissionï¿½s Seattle, Washington, Field Office, issued the referenced Notice of Apparent Liability for Forfeiture ("NAL") for a monetary forfeiture in the amount of seven thousand dollars ($7,000) to Two Way for the noted violations. Patrick Cleppe, owner and operator of Two Way, filed a response to the NAL on July 26, 1999.

II. BACKGROUND

3. Two Way is a consumer electronics dealer in Kennewick, Washington. On March 19, 1999, an FCC agent from the Commissionï¿½s Seattle Field Office, who was posing as a member of the general public, visited Two Wayï¿½s place of business at 220 Columbia Drive E., Kennewick, Washington. During that visit, a salesman who the agent believes is named Gary Greenfield offered to sell an external radio frequency power amplifier -- commonly known as a "linear amplifier" -- to the agent. The linear amplifier offered to the agent was capable of operation in the 26.965 to 27.405 MHz frequency band, which is assigned to citizens band radio ("CB") operators. Such a linear amplifier is used to increase the power of CB stations beyond the authorized level. On May 15, 1999, two FCC agents from the Commissionï¿½s Seattle Field

Office, who were posing as members of the general public, visited Two Wayï¿½s place of business.
On this occasion, a salesman, who the agents believe to be Mr. Cleppe, showed the agents Galaxy XL350 and Palomar 80 linear amplifiers and told the agents that an additional model (Galaxy XL250) was expected to be in stock later that day. The salesman offered to sell these linear amplifiers, which were capable of operation in the 26.965 to 27.405 MHz frequency band, to the agents. Section 302 of the Act, and Sections 2.803 and 2.815 of the Rules prohibit the sale or offer for sale of linear amplifiers that are capable of operation in the 26.965 to 27.405 MHz frequency band. On July 14, 1999, the District Director, Seattle Field Office, issued an NAL to Two Way in the amount of $7,000 for willful and repeated violations of Section 302 of the Act, which prohibits the sale or offer for sale of transmitting equipment not in compliance with the FCC rules, and Sections 2.803 and 2.815 of the Rules, which prohibit the sale or offer for sale of linear amplifiers that are capable of operation in the 26.965 to 27.405 MHz frequency band.

4. On July 26, 1999, the Commission received the response to the NAL, in which Two Way requests the cancellation of the proposed forfeiture. Two Way asserts: that Gary Greenfield was not an employee of Two Way at any time during March 1999; that Two Way is a proprietorship which has never had any employees; that its business records indicate it never purchased any linear amplifiers; and that Two Way collects sales taxes and charges $38.50 for installation and tuning. In addition, Two Way states, if its response does not close this matter, it is making a "motion for Discovery."

III. DISCUSSION

5. As the NAL explicitly states, the forfeiture amount in this case was assessed in accordance with Section 503 of the Act, Section 1.80 of the Rules, and The Commissionï¿½s Forfeiture Policy Statement and Amendment of Section 1.80 of the Rules to Incorporate the Forfeiture Guidelines, 12 FCC Rcd 17087 (1997), recon. denied, FCC 99-407, (Released Dec. 28, 1999) ("Policy Statement"). In examining Two Wayï¿½s response, Section 503(b) of the Act requires that the Commission take into account the nature, circumstances, extent and gravity of the violation and, with respect to the violator, the degree of culpability, any history of prior offenses, ability to pay, and other such matters as justice may require.

6. The claims made in Two Wayï¿½s attack upon the factual basis for the NAL are either immaterial or are directly contradicted by the observations of FCC agents. The agents who went to Two Wayï¿½s place of business observed linear amplifiers on the premises and received offers to sell linear amplifiers from salespersons believed to be Mr. Greenfield and Mr. Cleppe. This is sufficient to establish the violations alleged in the NAL and contradicts the claim that Two Way did not possess any linear amplifiers. It is not material whether the persons who made the offers to sell were employees of Two Way or proprietors.

7. Discovery is available in Commission adjudication proceedings that have been designated for hearing. Since this case has not been designated for

hearing, Two Wayï¿½s discovery motion is inappropriate.

8. We have examined Two Wayï¿½s response to the NAL pursuant to the statutory factors above, and in conjunction with the Policy Statement as well. As a result of our review, we conclude that Two Way has failed to justify cancellation or reduction of the proposed forfeiture amount. Therefore, we affirm the forfeiture of seven thousand dollars ($7,000).

IV. ORDERING CLAUSES

9. ACCORDINGLY, IT IS ORDERED that, pursuant to Section 503(b) of the Act, and Sections 0.111, 0.311 and 1.80(f)(4) of the Rules, the Two Way Shop, IS LIABLE FOR A MONETARY FORFEITURE in the amount of seven thousand ($7,000) for the repeated and willful violation of Section 302 of the Act, which prohibits the sale or offer for sale of transmitting equipment not in compliance with the FCC rules, and Sections 2.803 and 2.815 of the Rules, which prohibit the sale or offer for sale of linear amplifiers that are capable of operation in the 26.965 to 27.405 MHz frequency band.

10. Payment of the forfeiture shall be made in the manner provided for in Section 1.80 of the Rules within thirty (30) days of the release of this Order. If the forfeiture is not paid within the specified period, the case may be referred to the Department of Justice for collection pursuant to Section 504(a) of the Act. Payment may be made by credit card through the Commissionï¿½s Credit and Debt Management Center at (202) 418-1995 or by mailing a check or similar instrument, payable to the order of the "Federal Communications Commission," to the Federal Communications Commission, P.O. Box 73482, Chicago, Illinois 60673-7482. The payment should note the NAL/Acct. No. 915ST0007. Requests for full payment under an installment plan should be sent to: Chief, Credit and Debt Management Center, 445 12th Street, S.W., Washington, D.C. 20554.

11. IT IS FURTHER ORDERED that a copy of this Order shall be sent by certified mail, return receipt requested, to Mr. Patrick Cleppe, the Two Way Shop, 220 Columbia Drive E., Kennewick, Washington 99336.

Class C amps work very well for CW and FM, where having the amp turned on for less than 90 degrees will not produce distortion. Class C amps don't work well for SSB or AM, where you want the amp turned on for at least 180 degrees of the input cycle. That's why they call them "linear" amps, the amplification of linear amps is constant for at least 180 degrees of the input waveform. Class A, B, and AB are considered linear, and don't produce very much distortion on AM or SSB. Class C amps will produce distortion since much of the input waveform is not reproduced on the output. But Class C amps are more efficient, so you see lots of them being sold for CB use since output power, rather than signal quality, is what people are looking for.

I never said that the modulation was imposed on the voltage or the wave at the antenna. I realise that the frequency is set in the transmitter stages. I didnt quite word what i meant quite right...i call it a voltage because i have seen people test their radios by lighting a lightbulb off of the coax output when they put the radio into transmitt mode.

That's only true of they have an adequate output tank
circuit so that they can make use of the "flywheel
effect."

You're missing my point. When properly driven, there is
only a very small portion of the input signal that isn't
reproduced by an unbiased solid-state amp. A 4 watt input
signal is 40 volts peak to peak. Each transistor requires
about .6 volts to begin conducting. Two transistor, push-
pull amps are the most common in CB, so I'll use that as
an example. For the first .6 volts of the positive half
of the waveform, and the first .6 volts of the negative
half of the waveform, the transistors are off and not
reproducing. That's 1.2 volts out of 40, or 3% of the
input waveform that's not being reproduced. Here's
another way of looking at it: out of 360 degrees in each
cycle, the amp is on for 349.2 degrees. Yes, that makes
the amp Class C since each transistor is on for less than
180 degrees, but 174.6 degrees is close enough that the
output signal is useable. The amp is actually running
very close to Class B (where each transistor is on for
exactly 180 degrees per cycle). Most engineers will
agree that in a true, two transistor, Class C amp, each
transistor is NEGATIVELY biased so that it only conducts
for between 90 and 120 degrees per cycle. An amp set up
that way would NOT produce a useable signal in any mode
without an adequate tank circuit. Even then, the amp
requires extensive harmonic filtering to meet spectral
purity standards. Unless FM is the only mode to be used,
and the extra bit of efficiency is vital, it's actually
cheaper to simply bias the amp into linearity. Or, with
CB amps, simply accept the fact that there will be a small

amount of distortion due to the lack of bias.

Another thing to consider is that the drive signal to a
typical CB amp is larger than 40 volts peak to peak.
That means the percentage of off time is even smaller.
This is especially important when using an unbiased amp
on SSB. If the input signal is weak, or the amp is
running with alot of input swamping resistance (like in
one of its lower output positions), the audible distortion
will be more noticeable because a larger percentage of
the input signal will be missing. That's not a problem
on AM since there's no information being conveyed at the
crossovers (where the carrier is cutoff or nearly cutoff).
That's why the distortion caused by not biasing the
transistors is not easily audible on AM, but it can be on
SSB.

> But Class
> C amps are more efficient, so you see lots of them being sold for CB use
> since output power, rather than signal quality, is what people are looking
> for.

The difference in efficiency between biased and unbiased
CB amps is very small since it would require that the
amps be negatively biased to really see the gain in
efficiency that comes with true Class C operation.
As for output power, there is no difference between
the two (under normal operating conditions) since the
typical CB amp is driven well into the region where
gain compression is taking place. With small input
signals, it's actually the biased amp that has an edge
in output power.

The reason you see lots of unbiased CB amps is because
they are cheaper to build, can take more abuse, and,
the manufacturers realize that they are close enough
to Class B that they can be considered useably linear.

I have used FM on the 11 meter band for over 3 years, and you will get slightly shorter range than with AM, but the advantage is a cleaner crisper transmission. I have talked several thousand miles during skip on FM mode...it was a blast!! Base station to Base station you will be able to talk 5 miles on FM during skip conditions and you should also be able to do so mobile to mobile with properly tuned setups.

FM works perfect on 11 meters...with full quieting it sounds like a telephone.

I no longer have need for this radio and am auctioning it on ebay. The radio is in excellent shape and comes with mounting bracket, instruction manual, microphone, and DC power cord.

This is the model with the lighted dials and switches. It will operate in AM and SSB modes and has full 40ch coverage.

Please cut and past this link into your address bar to goto the auction.http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=303603612

Thanks and happy bidding,

Greg

Message-ID: <MXvH4.7057$s56.28945@typhoon.tampabay.rr.com>
Source record: 30295

The Northstar 9500 base station used a computer power supply to supply the 12 volts for the radio. The 5 volt output was run to a 5 ohm 10 watt resistor to maintain stability. The radio had an output equal to other base stations using its Galaxy style PC board and with a normal power supply. It is much cheaper replacing a computer supply than replacing a power transformer and other components after a lightning strike.

Source record: 30300

A variation or swing in frequency to acheive modulation is not beneficial in regards to range because the output of the carrier stays the same. What it really has going for it is quality of modulation tonality. FM also pretty much eliminates bleed over, unless your running a brain tumor factory. AM swing does though have benefits regarding range because Amplitude, or Power modulation increases its watts output directly in proportion to the amount of swing or variation of the modulation. In general, on AM more watts equals more distance capability. They both have their place.

Actually the gain figures for phased antennas are pretty accurate if you have a good ground plane and antenna currents in the antennas are equal. I did some gain measurements using out of phase antennas on top of a school bus and they were very close to published data.

Message-ID: <22274-38EFC52D-124@storefull-113.iap.bryant.webtv.net>
Source record: 30304

Whether a transmission is Line Of Sight or not has absolutely ZERO to do with the modulation type...FM included. But for the most part revolves around the FREQUENCY of the transmission. Granted, that the term Line Of Sight is a common phrase used to describe FM transmissions, but only because FM is the most common mode used in High Band VHF and UHF and up, and so is used very often. In other words...if you transmitt with AM modulation in the UHF band, your transmissions will be line of sight. In general...the higher the frequency, the more Line Of Sight. I mean, i have transmitted my voice on a flashlight beam, the mode of course was AM, but the transmission was absolutely Line Of Sight.

I have transmitted 2500 miles from Central California to Eastern Kentucky on FM...hardly Line Of Sight. If you read anywhere that transmissions of 30 mhz and down are line of site because the modulation type utilized is FM, you are reading flawed and inaccurate information.

Bull Cookies! There is nothing inherent in FM that makes it line of sight. Radio Teletype (RTTY) can be generated by an FM process -- it is called F1 in the Regs, phone is F3. AM adds audio sidebands to a 'carrier' (that doesn't carry anything) while FM steals the power for the sidebands from the carrier so that power level stays the same under modulation. Narrow FM was common on the ham bands in the 50s and was used worldwide. Sideband blew both FM and Ancient Modulation cleanly out of the water.

Interestingly, you can take two FM transmitters on the same frequency properly phased and generate AM. This little trick was used in standard AM broadcast for many years. Its only drawback was that two 25kw transmitters added up to about 36kw AM rather than 50 -- might have cut their range about a mile and a half.

==========
Shag,
If done correctly, a dual antenna, phased antenna system will produce a directional radiation pattern. Depending on the phasing, this pattern can be 'in-line' with the antennas, or 'broadside' to them. Sort of a two direction 'Superscanner'. Take any gain figures you hear about this kind of set-up with a large grain of salt.

Lowanse,
I think I WOULD use the ALC line with the '840 and
FL-2100b. The ALC prevents the amplifier from being
over-driven (too much input power). You will not need
100 watts to get full output from the FL-2100b. While
100 watts probably won't 'hurt' the amplifier, it does,
or I whould say, can cause distortion, and an excessively
wide signal. Other words a 'crappy' sounding signal.
The nice thing about using the ALC is that if it isn't
needed, it doesn't 'hurt'. If you don't use it and it
is needed, you'll wish you had.
'Doc
PS - About the "e" contacts... I'm assuming it is
earth ground. I'd test it to be sure.

> Also, keep in mind that FM is a line of sight transmission.

It isn't the FM mode that determines line-of-site transmission. FM on 27 mHz can propagate just like AM, CW, SSB or any other signal. It is the frequency used that determines line-of-site.

Message-ID: <11dea6da.73bd15d6@usw-ex0101-008.remarq.com>
Source record: 30362

FM also has the advantage of the "capture effect" - a stronger signal will dominate a weaker one underneath it and make it much harder for ***holes to annoy you.

A 27MHz carrier will get through equally well whether it's AM or FM. A well modulated FM carrier will be understandable just as well as an AM one. When the signal is too weak to make out anything, an SSB signal will still be easily understandable from the same station.

Listen to the hams using FM on 29.6 to 29.7 - it's quite usable for DX.

880. Randy your e-mail address is no good!

Newsgroup: rec.radio.cb
Date: 2000-04-08 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <38EF72BE.AC91EEF7@qnet.com>
Source record: 30366

Hello Randy: Fix your e-mail address, it was working. Next time your lookin in the mirror, slap yourself.

The 5/8 OD inch ground plane radials "DO NOT" need the factory tapered or swaged reduction to 7/16 ID. Take this to the bank. This will not in any significant manner affect the antennas performance. The quoted ratio of length to diameter, is dead wrong. You don't need to worry about it. This is just a little thing in your case will drive ya crazy running up and down the ladder, and drink to much beer.

Buy new 5/8 OD Aluminum Tubing, .058 inch thick, 33 inches long, 6063-T6 ot T8, its readily available). Debur the end that the 7/16 will fit into. Then cut this end of 5/8 tubing in a cross cut (two cuts with a fine toothed hack say blade) from the end of the tubing about 1 to 1 1/2 inches deep into the length of the tubing, in the 5/8 inch tubing. The 5/8 tubing will sinch down and tighten and hold the 7/16 tubing. Antenna fixed, have a cool one.

Throw away the piece of shit factory clamps, and replace them with good automotive stainless steel hose clamps. And your ready to reinstall. Make sure the ground radials are 105 inches long from end to end.

The SWR will be very close to 1:1 below channel 1, and about 1:1.9 at channel 40. Then shorten the antenna 3 to 5 inches, where the 1 1/8 inch tubing goes into the 1 1/4 inch tubing. Do not adjust the half round tuning wire or add a shorting stub. Adjust the antenna length for the SWR vs frequency you want. Buy the Heavy Duty, High Power, Low Loss tuning rods if you want less loss and more power handling capability.

Let me know how ya make out. Hope this helps.

Jay in the Great Mojave Desert, just down the road ah ways from the fillin station.

I'd like some info on some of the amps that some of you own. I'm considering a Ghostrider 2000 and would like some input from you all. I want an amp that will last and have good audio. I hear others saying this is better that that and that is better than this, well, I'd like to hear your opinions of the ones that you are running.
I know, get a Henry 2k. I need to be reasonable on the price. Does anyone have an opinion of a transitor amp over a tube amp? The Ghostrider has 8/ 2789 in it, is this a good transistor or is there a better one for an AC base amp?
I'd like to have all the info I can get so please send your opinions and thoughts about home AC base amps.
Thank you all in advance!
Steve

I remember those old hand helds. Are they just 1 channel? What channel is
in them now?

On 2000-04-07 dontownsend@home.com said:
Newsgroups: rec.radio.cb
I have two E F Johnson "Personal Messenger" handheld radios Model
242102 with leather cases. They are an 8 out of 10 cosmetically as
is without being cleaned up and will clean up into 9 or 10s. One
battery still works OK and the other battery will not hold a charge.
These handhelds are the ones with the "Plug in the wall"
rechargeable batteries. The units are 1 watt transmitters and have
serial numbers 30303 and 30311. Their date of manufacture is 1962.
Please let me know if you have an interest in them or I'd like to
hear from you if you know what they are worth.
Thanks,
Don Townsend in Phoenix, AZ

This works on all Northstar NS series.
Remove Bottom cover.
Locate the small board that has the channel selector attached to it.
On the right rear corner of this small board locate the small wire
loop and cut it open. This is about 3/16 of an inch loop. Open, or cut
this wire loop, right against the board.
Now locate the "YELLOW" wire that comes from the edge connector of
this same little board that has the Channel selector. It runs over to
the Bright/Dim switch. Some Place in the middle of this wire you will
see a black heat shrink tubing over the wire. You must cut away that
tubing, and reconnect the yellow wire, as it is an open connection
under that heat shrink.
Re Assemble radio.
To select a band, you must place the dim switch all the way to DIM.
This will now display a n1, n2, n3.... n8 in the channel selector
window. The CB Band is band 5 for most NS series, except the NS-3000.
Which is band 4.
Once you have selected the band you want, place Bright/DIM switch back
to bright. You are now on that band of operation.

Please explain how for example: A 3mhz FM signal transmitted at 10:00 pm with the use of a ground mounted antenna can travel from Georgia to Virginia.

Then why do I hear hams from the east and west coast and even other countries on 10 meter FM? I certainly can't see them from here. Just how does the F layer know the difference between FM and any other mode of modulation? Do you think is says, "hey this is an FM signal, don't propagate this one." Your are wrong, it has nothing to do with the mode, it is the frequency that determines if a signal will propagate via the ionosphere. Most frequencies at VHF and above are line-of-site, regardless of mode, below that skip can occur for a signal with any mode of modulation. Read this, the methode of modulation does not determine whether a signal will be line-of-site. You need to study up a bit on radio theory especially propagation.

902. History of the ORIGINAL 148GTL-DX?

I was one of the first people in the United States to own the Cobra 148GTL-DX. This radio only had 3 bands and the first Roger Beep. The President Jackson was the next radio to come off the boat (as I remeber). This was back in the mid 1980's.

My question is this... what is the history of the original 148GTL-DX. Who made the board for that radio? If I'm correct, it was a superior design to all the "Ranger" made derivitives out there today.

Also, does anyone have one for sale?

Dino

>delivered to a 50 ohm load.
>
>It makes no other claims, expressed or implied.

Not always. If the modulated signal does not have a constant amplitude
then the Bird 43 will have an erroneous measurement.

>RMS power readings are different than Average.

The term "RMS POWER" is not always accepted as the correct
terminology in expressing a quantity of power. In the audio field
"RMS POWER" is usually accepted as "THE" power measurement.

The term "AVERAGE POWER" is more easily accepted as a correct
way of expressing a quantity of power. Both of these term do express
the same quantity. That quantity is the "true power"or the "heating
power". In other words the real power averaged over a sufficiently
long enough time period.

>The Bird meter is NOT an RMS reading meter, it is an AVG reading meter.

True in the way that it measures. It can only measure and then express
a power as it equates to a average voltage measurement. An average
voltage measurement of a varying waveform will not give a accurate
account of the corresponding real wattage.

>The only way to measure RMS power reliably is with a calorimeter.

Or the Bird APM-16 electronic average reading wattmeter.It will give
accurate readings with various different waveforms.

I personally don't like FM. I usually use it for close range communications. It doesn't have the swing that AM or SSB does. It also will transmit at a steady watt. Depends on what type of radio you use. FM works very well on VHF and UHF, but I think it really does bad on the 11m.

After all, swing that makes watt meters and s-meters go wild is
everything on cb.
Technically FM has much more "swing" than AM or SSB, as AM and SSB
modulate by varying the amplitude of the signal, whereas FM modulates by
varying the frequency (swing) of the signal.

> It also will transmit at a steady watt.

That is one of its advantages. You don't have to see meters bouncing all
over the place to have a good signal.

If you don't know which to get, I would suggest getting both. SSB is my favorite, but FM has a couple of advantages. I have an AM/FM CB in one of my cars. Works pretty good. AM range is slightly better but FM is much clearer until it starts to break up. DX on FM is not that great though. If you have a lot of QSB it makes it much rougher than SSB.

: << Jumping to conclusions, aren't you?

: I submit that my conclusions are likely quite accurate.

: Ameritron states that it will provide information on the 10 meter mod for the
: AL-808B to any licensed amateur with proof of license. Based on this
: information, plus the fact that the originators request was posted to
: rec.radio.cb, it is logical to conclude that the original poster was someone
: other than a licensed amateur who intends to use this equipment on CB.

Personally, all I would conclude is that someone asked on this group about
the mod for the AL-80B amp. It is not the best place to ask, but you would
sometimes be surprised about the things some people know.

I have no way of knowing whether the person plans to use the amp on CB, or
is an Amateur or just someone who has an amp and is working on their Amateur
license.

A number of the local people who run illegal power on the CB bands locally
are licensed Amateurs.

2 kw amps? how come the ham on 10 meters running the same power isn't bothering you? I'll tell you why, cause you are a whinebag bitching about the same thing your buddies you are trying to be like bitch about, it is a common problem in society, some people try too hard to be someone they are not, this is a REAL problem amongst the ones who really envy big radios, you sir have proved this point.....Good Day Whinebag!!!!!!

One thing to note is that FM is a much more efficient mode than AM, and I have found it to me much less susceptible to interference than AM. I would recomend one of the many radios that offer all modes, i.e. AM/FM/SSB. Personally I have found FM to have a better range than AM, and SSB to be better than both, in terms of audio clarity FM beats both AM and SSB hands down. Hope this helps.

You can convert them to a 250watt or what ever they are rated for and just about any voltage you want by rewinding the transformer.I have not tried it yet but understand that it is pretty easy to do. I know a guy that gets +/- 50 volts out of one for a stereo amp.

I would reccomend that maybe you should pay more attention. I have DXed all
over the world on FM and have the cards to prove it. Listen on 26.515 and .525
when the band is open and you would be amazed at what you might hear.

hi, what is proper hook up for a yaesu 2100b to a yaesu 840?
using the 8 pin band data plug, and the alc jack . the 8 pins on band data
are marked:
1. +13.5volts
2. tx.ground
3. ground
4.band data a
5. band data b
6. band data c
7. band data d
8. linear
here are the connections on 2100b (they are screws)
1.e
2. alc.
3.e
4. relay
there is aslo a rca jack on radio for alc, would you connect alc rca jack
on radio , shield to 1. e on amp,and center wire to 2. alc. (does e. on
amp mean (earth ground)
any help on this would be greatly appreciated.....

Hmmm...so far, yery interesting responses.

Since I don't yet have a FM rig, the premise would be to eventually get them for local conversations -- if there were others in my location that *have* FM capability.

Since I have a VERY small antenna setup (CCR's in my neighborhood ..the tip of my antenna marginally clears my roofline, so my five mile rang is base-to-base and base-to-mobile.

How much mobile-to-mobile conversation would be experienced with an FM rig? I didn't post im my original message that I am a long-time SSB owner -- both base and mobile. Most of the time, if I want to have a nice, extended conversation with someone on the base, I ask if they have SSB capability -- the answer most of the time is no.

I'm just wondering what luck I'd have while traveling if I was to run into the same situations -- having the capability is great (...illegal, I know...but great anyway!) if there's folks out there to talk to!

I'd be willing to bet if my ratio's were something close to accurate on my initial message, the percentage of FM capable rigs is -- half that of SSB??

I guess I'm asking some queasy questions here...just what percentage of Export-Only radios are out there?

Feel free to e-mail your estimates -- no I'm not Unca Charley!!

I'm just trying to justify the extra $$$ for the radio -- help me convince the XYL, gang!

You ask better questions than you know, sir PondScum. The 1500 PEP amp on
10 meter SSB:

1. Wasn't built in someone's garage in the dark of night.
2. Actually draws some resting current. It is not biased beyond cutoff so
it at least has a prayer for linearity.
3. Is not driven into cloud-cuckoo-land. The ALC is connected and actually
works.
4. The input signal is clean enough to deserve amplification.

So yeah, "really big radios" do stir emotion -- about like a TV lamp
including a statue of the Virgin with a Telechron clock in her stomach. It
is not that it is done poorly but that it is done at all.

840 2100

tx grnd = relay

e = e

The radio does not exceeed 100 watts so you won't need alc.

Since you mentioned FM, Dont know where you will get one in that price range new. Try finding a President HR-2510 or Lincoln used. Very reliable and great talkers. These radios can be modified easily by hardwire mods or by changeing the CPU.

Sounds like it could be a bad coax. If the antenna has been up there
for a while, It is a good idea to take it down and clean it up a bit,
then check your coax to make sure there is no breaks in it.

Your thinking of the DX-100.

It had clips on one side, and would screw down to the chassis on the other.

Wired the relay up to your PTT line on the inside of the radio.

Had to convert your radio to a solid ground chassis, rather than floating gr
ound.

It would run on 4 watts or 8 watts (input, carrier) 12 or 25 pep just by mov
ing a jumper internally.

It would fit on, and work on, any radio that had the same size chassis as th
e 148 (Grant, XL, Old Grant, 138, 148, Superstars, Presidents, Unidens, RCI,
etc., etc. ,etc). Ran a single 2879.

They where decent, just don't overdo it with them.

The manual stated to keep your carrier at about 20 watts, and if you did, th
e thing lasted forever.

If you didn't, your tech was soon replacing transistors.

They did about 130 SSB.

I would like to find one nowadays.

They also made a device called a "Stinger 100" that supposedly did the same
amount of power, with NO heatsink, and replaced the internal speaker. This
made a nice oscillator out of your radio, and was a piece of shit.

Sure it will accurately read a modulated am signal.

You have to modulate it at NO MORE THAN 100 PERCENT, and use a single tone t
o modulate it.

Anything else, and you are reading gibberish

Actually, the Bird meter is guaranteed accurate when measuring Average power delivered to a 50 ohm load.

It makes no other claims, expressed or implied.

RMS power readings are different than Average.

The Bird meter is NOT an RMS reading meter, it is an AVG reading meter.

The only way to measure RMS power reliably is with a calorimeter.

Rational discussion... here? :)

On a serious note. If you have the option to get one of the other.. I would go with SSB. For the purpose of "true" CB communications SSB and AM is where it's at. There are numerous reasons why, skip being one..

Also, keep in mind that FM is a line of sight transmission. You wont have access to repeaters (well, maybe you will) to keep your signal going.. Therefore with this you have shorter range capability than with SSB. Though, if you want at times good short distance communications, then you would use the FM. FM of course has a tendency to be quieter (as far as lack of static, etc) which would make execellent long trip conversation.

I would suggest looking at a radio with both modes.

961. Re how much horse power to turn an alternator

Newsgroup: rec.radio.cb
Date: 2000-04-08 00:00:00 UTC
From: Bean <butter_bean_mobile@my-deja.com>
Message-ID: <8cnt48$u16$1@nnrp1.deja.com>
Source record: 30497

The question was posted a while back. How much horsepower will it take to turn a alternator.hmmmmmmmmm it had beem a LONG TIME since I had but i thought I could figure it out. I used a 200 amp for an example. A 200 amp alternator charging at 13.8 volts will take almost 11 horse power to turn under a 200 amp load. It depends on the tempature of the alternator since the heating of the alternator affects the efficiency This figure is at a 60% efficancy. So after a few keys and the alts heat up I think this is a good measurement of horse power it takes per alt.
73 to all,
Bean

Because of so many requests via email to repost this because they did not see it I will repost the story here....
Enjoy Folks!

"Breaker, breaker channel 10 for a smokey report."".....boy how times have changed! In the summer of 1974 I bought my very first CB radio. It was a used Robyn WV-23. I also bought top of the line antennas, factory co-phased Hustlers on gutter mounts. I got a radio check from Virginia and I was in the hills of Kentucky. I didn't have a clue what "talking skip" meant. Within a week I was invited to a local house to see a base station. It was a five-channel Johnson. Not channels 1,2,3, but channels A, B, C, D, E. I was amazed. The CB was now my hobby. I spent hours in my car, day and night, just so I could "ratchet jaw." Later I would learn, quite by accident, exactly what skip was. While babysitting for my sister and her husband in 1977, I was talking on his base station. A lady in Texas, while I was in Florida, said hello and asked me where I was. When I told her, she surprised me by telling me where she was. I was so excited. I didn't know what to do. I wished her well and signed off with my brother-in-law's F.C.C. issued license number. When they returned home, he was, to say the least, adamant in teaching me the do's and don'ts of skip talking. Don't give out your address or "call numbers" while talking skip, (more than 100 miles away). He assured me it was an engraved invitation to Uncle Charlie, the F.C.C.

Soon after I got my Robyn, the CB took a drastic redirection. The truckers moved from channel 10, (where they interfered with channel 9, the emergency CB channel) to channel 19. The 23 channel radio became a thing of the past when the new 40 channel models hit the market. Cobra, Pierce Simpson, Browning, Tram, Teaberry, Radio Shack, J.C. Penney, Sears, and all others were forced to conform to the new F.C.C. regulations.

I used my Robyn for three years before I sold it. I bought a Sears 40 channel mobile and by 1978 I decided I was ready for my own base. A radio friend, (by now the term 'good buddy' is getting old) built a four-element beam for me. Another friend accompanied me to Sears where I bought the biggest mobile they had. It came with a matching power supply so you could use it as a base. I was thrilled. Now I thought I was big time.....

A way to meet all the people I had made friends with on the air was to attend the local CB jamborees. What fun....there were booths set up with equipment for sale, refreshments, contests between clubs (most dressed in club apparel, farthest traveled clubs, first club there, etc.), raffles, dances, and fun. The Top 20 jamboree was held in a different state each year. In 1978 it was held in our area. Being a three-day event, we got rooms at the Holiday Inn and stayed for the duration. It was so much fun meeting people from all over the country that I had talked skip with.

Skip talking was becoming more and more interesting to me. I listened a lot at first, but by the end of 1978 I was getting quite good at talking skip, too. Of course skip talking was illegal, by F.C.C.'s rules. So was using more than four watts of power, cursing, playing music, dead keying, etc. Some folks don't know it, but it's still illegal. These days the F.C.C. really doesn't have the man power or the interest in policing 11 meters. But, in 1979 they did.

Early one morning that year, the F.C.C. descended upon our town. They would, before the day was over, inspect, fine, and confiscate equipment from 58 of the illegal base stations and one mobile. They would revoke the licenses of two CB shops and close their doors for business, forever. The one mobile that was cited was a female friend of mine. She was sitting by the bayfront shooting skip with 100 watts, completely unaware of what was about to happen. Elsewhere, another friend of mine had just been fined for extra frequencies, (channels we're not supposed to have) in his base station, while still another friend (by now 'good buddy' sounded goofy to us) was having his Phantom 500 amplifier confiscated. I was glad I was at work and not sitting at home. Otherwise, I would have been number 60. Before it was over, there were considerably fewer stations on the air and everyone was quite humble. Some regrouped and reloaded, while others gave up the ship for good. In other parts of the country D&A (formerly Phantom), Browning (makers of the famous Golden Eagle), Tram and their fabulous D201, Dac, Maco (who later recovered) and others were also feeling the heat. The mighty businesses were all leveled in one blow by Uncle Charlie's heavy hand. We would now see the end of an era. It was a scary situation.

It was a very slow recovery for us. After having all the radios, amps, and air space we wanted, we were now reduced to paranoid little mud ducks. All you had to do was mention Uncle Charlie and people ran for cover. There were still a few of us adventurous types who found occasion to use a little extra power, but we knew we weren't out of the woods yet. In 1982, Charlie was still keeping a watchful eye on us. Occasionally they would pay someone a visit just to keep us on our toes.

In 1981 while people were still trying to get over 1979, a new and exciting experience presented itself to 11 meters. The 11 year cycle. It seems that every 11 years, for a full year or more, we can talk all over the world with little or no power. It was amazing. I was still, for the most part, a rookie at skip talking. But, I learned even the most inexperienced operators can talk around the world during this time period. I talked to France, England, Egypt, and South Africa. It was incredible.

As the years went by, so did Charlie's interest in 11 meters. More and more Cbers were turning to ham radio and computers. Satellite and cable TV were more of a concern. Uncle Charlie no longer required Cbers to buy licenses. After all, the F.C.C. could make considerably more money off other media. By 1985 the CB was starting to pick up again. Beams started being raised, amps started warming up, extra frequencies were becoming more and more popular. It looked like the CB would live again.

I had been dodging Charlie for six years by now. I had successfully avoided him while running a Pride DX-300 (a highly sought ceramic tube amplifier built by predominantly disabled personnel) on an eight-element Wilson Shooting Star beam

antenna since 1979. In 1985 I bought a used Laser 400 (also made by Wilson) and (because I kept blowing capacitors in my Pride) a Yeasu ham radio amp. I was getting about 600 watts and was considered one of the loudest stations in Florida. I have to chuckle ....these days 600 watts will barely get you to the next county, let alone another state. Unfortunately, it was fire that confiscated my station, not Uncle Charlie, in April of 1987. The only equipment I had left was the Laser (standing 54 feet tall with the charred coax blowing in the breeze) and incredibly, my rotor control box. At least I wouldn't have to replace the beam. Wilson had sold the design and rights for all their beams to Maco, who were famous for amplifiers and who somehow survived the Bust of '79. The prices of the beams would rise considerably.

I started over with a Cobra 2000 base station. Slowly but surely I bought an amp, a watt meter, extra channels, a D104 microphone, etc., etc., etc.

I had been talking skip on channel 32 since 1978. My beau, being as curious as he was about radio, started surfing the channels. Before long he had made friends (by now 'good buddy' is an insult) on channel six. I was always reluctant to talk there because they had enormous radios. I was sure that everyone there was running a KW, (1000 watts) or better and I didn't think I would be heard. I had a couple of radio friends there, but I was still too timid. I'm over that now.

The longer we talked on channel six, the more we knew and understood The New CB. The old CB jamborees are now called Breaks, or Functions, or Keydowns, or Shoot-Outs. The major yearly breaks are like the old Top 20 jamborees except now they include contests between mobiles. The vehicles line up like race cars and "shoot- out" (also called 'keydown') to a distant station to see who is the loudest. I remember my first linear. It was an Outcom (now Texas Star) 200 and that 200 watts made me one of the loudest mobiles in the county. Now days the big radios are running anywhere from 3,000 to 75,000 watts. The "top of the line" Hustler antennas are practically extinct. Now huge coil antennas and antenna arrays are the way to win contests. And my little Outcom 200 ran fine on my factory alternator. Nowadays a stock alternator is for headlights and turn signals. Two or three or five or six alternators are a normal sight, as are two or three or six antennas in an array on a car or pickup truck. Now A/C boxes are the King of the Hill. Unfortunately, A/C amps emit a dangerous amount of RF and can cause cancer. That's why our club is sticking to Storm Built D/C amps. I lost a good friend in the 80's who constantly had his face in his A/C amp. He developed lymph-node cancer and passed away at the tender age of 26. The folks who talk on channel six in New York lost a friend and technician when he got zapped by an A/C amp. It's not a fluffy hobby anymore. People have invested enormous amounts of money, time, blood, sweat, and tears in the CB. It annoys us to hear a non-CBer ridicule our hobby. To us, it's not just a radio, it's part of life. A lot of people have left CB because of mentally unstable people that have nothing better to do than torment other operators. The only way we can prevent that, since Uncle Charlie will not, is to stay united in our quest to rid the air of people like this. Women and children should be shown some respect as with all humans. Respect yourself and others will respect you.

Tell me about it. Remember going to the CB Jamberee's here in Michigan
as a young child. (with my dad.....) and also remember the meetings of
a club at the "Sambo's" Resturant in Talyor, Michigan.......(can't
think of the club though........ that's going waaaaaaaaaaay back.

I have a TS-850 which someone modified for transmitting in the CB band. In doing so, they did something which blocks activation of the WARC bands. I'd like to undo this mod, but I have never found a description of how it was accomplished. There is a toggle switch on the rear apron that switches this mod in and out.

I've opened the rig to look for the changes. But the person did the modifications so skillfully that I can't tell what's "factory" wiring and what's not.

Any suggestons will be welcome.

11-meter mod:
1. Disconnect power and antenna.
2. Remove the 16 screws,top and bottom from the radio.
3. Remove the top and bottom screws from each side of the
front panel assembly.
4. Pull the front panel forward to expose the digital board.
5. Locate and cut the lead from diode D-11.
6. Reassemble the radio.
7. Reset the microprocessor (Hold the [A=B] key while turning
the power on.)

Hope that helps!

Hey Doc

This whole thing is really as much an intellectual persuit as anything. I just know there are nice sounding effects from the audio world and grow weary of the same old echoes we all hear so much.

I turn my echo off when I'm on SSB, and I run it so low that most people say they don't even notice it (it turns on my talkback which I sort of like to hear). I don't know about everybody else, but if I can hear my echo in my talkback, it's too loud for the other folks out there. I turn on my scanner to a non-busy channel and set my echo by listening to what it sounds like on there.

So no, I'm not out to distort my audio and sound like I'm in a cave. I would however, like to have a very clear but somewhat unique sound.

Whether I have any 'content' or not would be subjective. Generally I stick to business - traffic, cops, weather and that sort of thing. I'll pop on SSB now and then just to see if my barefoot radio will get out and say hi to folks in canada or florida, or new york or california. I manage to get out okay on the mobile normally driving from KC to Dallas. Those SSB contacts are definitely lacking in content - it's a "hi, how are you, where are you" kind of deal, but they pass the time and are fun nonetheless.

So there you have it since you asked.

Mostly cost. There are generally two other approaches to AM, grid modulation whose efficiency is so rotten that you not only need bigger finals but also a blower that should have a 'powered by Cummins' sign on it to get near 50 kw out and the more familiar hi-level or plate modulation. To modulate a 65 kw (input) Class C final would take about a 35kw modulator (broadcast xmtrs use some cutes to get a bit more audio on the positive peaks while still not trying to reduce the output below zero on the negative side). Being audio the modulators run about 60 percent efficient in Class B so the input power also approaches 65kw and you get to buy a modulation transformer with pretty robust windings and insulation to do all of this. Then there is the issue of the power supply to the modulator that has to be absolutely 'stiff' and not poop out on the peaks -- sort of like what you get when wiring a big sub-woofer to the battery with zip cord. The modulator is a moose and to top it all off the final in AM service is not as efficient as when running FM. All of it added together made the two FM transmitter approach cheaper.

As you can probably figure out, there really weren't two whole FM transmitters. One exciter with all the FM done was divided between the two along with the 135 degree phase shift needed to get it to fly. The two were amplified separately and then recombined. Most transmitting tubes can be run a bit higher up the curve in steady carrier (FM) service, there are no fluctuating demands on power supplies, and things can be a lot looser with no ill effects. Not only was the hardware cheaper, the power bill is lower.

Of course you could just use an AM linear and settle for 30 percent efficiency maximum, less if you had to run AB1 and not draw grid current like a lot of Japanese transceivers. Haul out that Cummins blower, Jake!

Dick

Source record: 30339

FM is usually equated with VHF frequencies, which are line of sight. However, FM at 11M (or 10M) is not affected in that manner. It is an ionosphere reflected frequency range, and all modes of modulating the signal are treated equally in their delivery. I would also site the Virgin Island repeater system as a good example. You can hear traffic from around the world on it, and it can be worked with less than 50 watts from most paces in the States during enhanced band conditions.

Jeff was absolutely correct in the statement that frequency, not method of modulating the carrier determines line of sight conditions. Even with the VHF line of sight limitation, it is not unusual to work from Georgia to the Canadian border, or as far west as Texas on VHF during enhanced conditions; on SSB or FM. There are 17 different types of propagation patterns that affect signals above 50 MHz. That is the entry level frequency into the realm of VHF. Any of these different propagation conditions can remove the line of sight restriction; even at VHF. Tropo Ducting is the most common, and it simply traps the signal in a "buffer Zone created when different temperatures in air masses prevent the air masses from merging and "duct" the signal throughout the buffer until the masses dissipate or eventually merge. This is most common during Spring and Fall, when at morning and night the lower atmosphere heats or cools more rapidly than the more stable upper atmosphere. When a signal enters this "duct" , it is traveling in the usual horizon limited line of sight mode, but is contained in this duct and effectively bent around the curvature if the earth and "ducted" far beyond Line of Sight. In fact, the book "Beyond Line of Sight" gives detailed accounts spanning the last 50 years of VHF and above communications where the line of sight rule was broken by enhanced conditions. Tropo Ducting is just one of the propagation patterns that allows this. FM communications ore sited repeatedly in the examples given and the documentation proving their existence.

In all subjects, the one thing that determines the difference between conversation and debate is the introduction of facts. Conversationally, FM can be considered Line Of Sight, just as Pigs Can Fly and Elvis isn't dead. However in actuality the facts will prove that FM is a modulation scheme, not a propagation pattern.

Just the Facts,

David

And while you are at it, include the same signal at 52.525, 146.520 or 446.52 can do likewise. We are all eager for enlightenment, and need to know this soon, so we can rewrite history and educate those poor fools that lived before us and didn't know any better.

It is always advised not to attempt flight when you are overly weighted down with fecal matter. (Never fly off the handle when you are full of CaCa)

1006. Re: FM vs SSB

Newsgroup: rec.radio.cb
Date: 2000-04-09 00:00:00 UTC
From: Ken Thompson <kwthom@azstarnet.com>
Message-ID: <sf12ed6fcqv12@corp.supernews.com>
Source record: 30406

kwthom@yahoo.com wrote in message ...

Gee, honest-to-goodness rational discussion in the NG *can* happen -- okay, yeah, rare, I know...but it looks like it is possible! :-)

So, to summarize for those just gettin in the loop here...many have stated that AM vs FM distance on 11/10m are roughly comparable (I knew that...), and that max distance would be using SSB (knew that too)

>I'm really torn on a new radio...FM, SSB, or both?

Most have stated that the correct answer would be to pick up a rig that can do both modes.

>How well does FM work on the 11m band -- is it possible for reliable
>local (5 mile or so) communication when the band is active with skip?

Consensus is yes, it would -- albeit illegal stateside.

Now, one of my follow-up questions really didn't get addressed. It seems that FM is "widely" available in some areas of the country, while in others, it seems to be rather scarce (...at least on 11m/freeband freqs...)

I'm still trying to determine the approximate percentage of operators out there that *may* have this capability. In my example, I made a rough estimate that 15% would have SSB -- let me clear this up -- this is only speculation on my part. Now, do you think that the number with FM is smaller than that figure, approximately the same, or much, much smaller than my speculation?

>Thanks...reply to the ng, please!

Please continue to reply to the newsgroup -- aways nice to see the responses piling up on a subject like this.

Cross-posted to: rec.radio.amateur.equipment,rec.ham-radio.swap,rec.radio.amateur.swap,rec.radio.cb,sci.electronics.misc

This Lot consists of the following slugs: 1. 25-60 MHz 25W (NEW), 2.
50-125 MHz 50W (USED), 3. 100-250
MHz 50W (NEW), & 4. 200-500 MHz 50W (USED). One of the new slugs has the
letters smeared but I assure
you it is new. The two used slugs are in like new condition. These slugs
come with a money back guarantee less
S&H if you are not satisfied with them. I am asking $175 for all four.
This is about half of what I have in them.
These slugs generally run from $80 to $100 new. Buyer pays $4.50 S&H to
anywhere in Continental U.S. and Canada. Shipping will be via 2-3 Day
Priority Mail. Other methods can be arranged if requested. Payment must
be in the form of a money order or certified/cashier's check.
Please email if you are interested or have any questions.
Thanks in advance!!!

James

Source record: 30415

Steve,
It isn't the transistors, or the tubes that produce
the TVI/RFI, it's a matter of filtering. Except for a
few commercially made transistor amplifiers, most broad
band amplifiers do not have adequate filtering. Same
for the tube amplifiers.
Transistor amplifiers make sense for mobiles because
they do not require high voltages. Tube amplifiers make
sense for a 'fixed' amplifier because a high voltage
supply isn't a problem there.
Depending on the tube, most tubes are usually more
'forgiving' than transistors are. Ceramic tubes are
less forgiving than 'glass' tubes by an order of magnitude,
(and are expen$ive!) and sweep-tubes are the next best
thing to trash (572b's and 811's are the exceptions).
So, "you pays your money and takes your choice!"
'Doc

Lowanse,
Lo-pass filters do little good, but you'd better have one if your ever inspected. One between the radio and amplifier is worth having, just extra protection. Shop around, a company called "ICE" makes a good 'cheap' one. Also, get one with double the power rating that you transmit if you can. Sounds like 'over-kill', but it really isn't.
'Doc

> You been talkin to too many no-code techs.

After seeing this drivel, I am compelled to paste in canned response #251 to your statement. I try to keep the most recent 1000 responses I make to this allegation on file for quick reference whenever someone lets their mouth get ahead of their brain.....

I am a dreaded no-code tech. I started off with a computer assisted Satellite station. I soon grew tired of reliable 4 to 10 hour skeds with at least 5 nationalities on 3 to 5 land masses separated by large masses of saline solution. Of course these QSOs were via VHF/UHF satellite repeater (SSB of course). Tired of shooting fish in a barrel, I moved on to the challenge of weak signal terrestrial SSB operation. In the period that I was active, I consistently placed first, second or third in the state in all contests. I set up a portable Oscar Rig for field day and got media coverage for our local ham community. After the winter storm of '93 (I was enroute to the Orlando Hamfest and back during it's fury), I wrote a program for determining the proper mast tensile strength for multiple horizontal yagis mounted to a single mast. It still resides on the ARRL ftp site under the Programs directory, named mast.exe. It was in answer to the thousands of dollars of damage regional hams suffered due to this larger than usual winter storm. I soon became disgusted by the overall behavior of the brass pounders that seemed to be the most vocal of the ham community, and sold most of my gear and became inactive. As president of the local Ham club, I grew tired of their resistance to anything that threatened the level of their lack of knowledge, i.e. Progress..... Today, I listen, and try to offer assistance to new hams. I also repair gear for the Generals, Advanced and Extra class ops in my area, while continuing to expand my knowledge and practical experience in the field of electronics and communication. I will jump in for disaster relief, most recently providing communications for a shelter when forced to evacuate for one of the non-hurricanes to hit the southeast. I heard a request for assistance, and I located the shelter and provided communications assistance to GEMA and the Red Cross via the local 2m RACES operation. I offer parts for anyone in the area interested in homebrewing, and try to assist in repairs and trouble shooting to the extent of my ability. The most prominent advantage of coded licenses seems to be the inability to tell the difference between reality and fantasy; the saga of being a legend in their own mind..... The only contact I maintain with the "Higher Class" license holders is when I answer their technical questions or repair their gear.

Am I claiming to be SuperHam, not hardly. I am categorized as not knowledgeable to operate the coveted 7 MHz of spectrum that surrounds 11 meters and is know by the following nicknames "160m", "80m", "40m", 20m" and "10m" (Plus the W.A.R.C. granted offspring). However, I can and have

utilized from 50Mhz to 440MHz (That's 390 MHz of spectrum for those who rely on binary oscillations created by a momentary contact spst switch i.e. CW).

What is wrong with this picture?

I feel like 75 meters serves the same purpose as most "real hams" claim 11 did, by keeping the riff-raff off the VHF and above spectrum where the only advancements that I have seen to the hobby have been born in recent years. Leave us 100 GHZ of spectrum while you play in your 7 MHz sandbox, trying to determine whose is bigger.... Personally, I have more confidence in my ability and accomplishments to regress to that type of mentality.

David
KD4NUE

Using CW as a measure of proficiency for voice communications is like being required to shoe a horse before obtaining a drivers license....

Any Questions??

1022. Talking about FM....

I have an Eagle Sidewinder 400 with AM/SSB/ and FM. I have a question about the FM power output. The manual says 4 watts AM and FM but with the AM/FM power VR pot cranked up the AM carrier is 7 watts and the FM power reads 17 watts. Why the difference in the power readings? I didn't want to prematurely burn out the finals while using FM so I lowered the VR pot until FM power was at 10 watts. Now the AM carrier is 3 watts and swings to 15 and FM is 10 watts. I thought that AM and FM power output levels where suppose to be the same?

Ken, I know from bananas about CB operation but I think the short answer to
your question is this: get FM if and only if your main aim in life is to

talk with people in countries where FM is required on 27 Mhz.

The next obvious question is why they required it and we did not. We didn't because in 1958 FM was 15 khz swing in 50 khz channels so 40 channels made more sense than 8 - simple as that. After a few years proved that FM could be run in a 10 khz channel this reason disappeared. After the US experience, other countries required FM because:

1) FM is a receiver dependent system. All over-deviation, power mikes, etc will do is make you sound like garbage to a receiver expecting a calm and quiet 3.5 khz swing.

2) If and when someone chooses to obtain an amp it can be -- like most from UnderGround Amps R Us -- a monumental piece of junque and still not cause the havoc and chaos that it would cause from trying to amplify an AM or SSB signal while biased well beyond cutoff. FM runs admirably in Class C while AM/SSB are reduced to buckshot all over the spectrum.

It is required in a number of countries to make the regulator's lives a lot simpler -- no better reason than that. For communication, SSB is the only way to go.

Dick

1029. Re: lowpass filter ?

Newsgroup: rec.radio.cb

The best place for a low pass filter (LPF) is immediately before the transmitting antenna. Of course that means it might have to handle higher power, but that's where it's most effective. More on this later.

LPF's were intended to provide reduction of harmonics, such as the 2nd harmonic at 54 MHz, i.e., 27 x 2. 54 MHz is near television channel 2. In other words, the LPF for CB frequencies is mostly for preventing TV interference.

If the CB (driver) is generating a second harmonic at 54 MHz, it is not likely that the linear amplifier will respond to the 54 MHz signal. So the benefit is limited by using the LPF between CB and linear amp. On the other hand, it's often the linear amp that generates the harmonics, and the only place you can reduce those harmonics is after the amp.

ARRL Great Lakes Division Director

HERE ARE THE DETAILS OF THE ANNOUNCEMENT

I have received word from Gerald Rosner, N8FGK, that the Grosse Pointe
Woods Hamfest, scheduled for Sunday April 16th, 2000 and sponsored by
SEMARA has been officially cancelled. The Hamfest Committee met late
Friday, April 7th, and made the decision. Lack of advance table sales
and Dealer participation was at the heart of the decision.

The Officers of SEMARA are sorry to have to cancel this formerly
popular Hamfest, but needed to take necessary action to cut their
losses to a minimum at this late date.

1032. Re: Re how much horse power to turn an alternator

Newsgroup: rec.radio.cb
Date: 2000-04-09 00:00:00 UTC
From: Expert <nobody@nowhere.com>
Message-ID: <38F0C066.5A29FB88@nowhere.com>
Source record: 30432

Let's look at it this way. I'll round off at two signficant figures, since this is just an estimate anyway.

(200 A) * (14 V) = 2,800 W power required at 100% efficiency

(2,800 W) / (0.60) = 4,700 W power required at 60% efficiency

(4,700 W) / (750 W / HP) = 6.2 HP required to power the alternator

That's a maximum power only required when the alternator is generating 200 A.

Hello Lowanse: Yes I would place a lowpass filter in front of and after the amp to help suppress all the nasty harmonics. And have a good ground from a near by ground rod, ground all the equipment.

The problem with TVI is that your system is in very close distance to the neighbors antenna usually, and you may also be over loading the neighbors TV. That is, your transmitted signal is so close to the TV, and or TV antenna, that some 27 MHz RF filtering may be needed on the TV set, coax, or antenna. Highpass filters can be bought at Ham Radio Stores, that connect to the TV set, this will help reduce interference. The lowpass filters work best with a low SWR. They are made to work at 50 ohms impedance.

Hiring a professional to come in and look over a neighbors TV installation may not be a bad idea, at your expense. TVI complaints can snow ball into a big thing between neighbors. So by being a good neighbor, you are doing the right thing in trying to fix the neighbors interference problem. And will look like your a good guy from a judges view point, should it get that far. Important tip here, always be a good neighbor, tell the neighbor that you will fix the problem. Its cheaper and faster if you do it.

If you have a A99 type fiberglass antenna, you might think about replacing it with a MaCo V5/8 Ground Plane Antenna, with new coax, I use LMR-400. Or moving your present antenna away as much as you can from the neighbor. I have heard countless CB'ers say that they have replaced the A99 with a MaCo V5/8 and reduced or eliminated the interference problems.

TVI can be a real can of worms, and drive ya nuts. There are 2 books that are sold by the ARRL at Ham Radio Stores, that cover the interference problems. Also CQ Books sells a book on interference. These are a treasure of information on the interference problems.

Hope this helps.

The best place for a low pass filter is just after the transmitter or amplifier and connected to a good ground, and keep the coax from the transmitter/amp to the filter as short as possible. You want to stop any harmonics or other spurious frequencies from getting to the coax going to the antenna, and you can't get a proper ground on the filter at the antenna. Why would it have to handle higher power if placed at the antenna? It isn't going to handle any more power there than at the output of the transmitter.

Aside from all the debating, has anybody heard or have the RF Limited Magnum Delta Force 10m radio? I recently just purchased one of these. The specs look great. Does it do well on 11m? Just wondering if it is a really good radio. I think it came out last year.

Hello,
I figured a lot of people would be interested in this. I have the movie Citizens Band (VHS) on Ebay. This movie is hard to find and sells for $60 on Amazon.com. Not only is this hard to find, but this is an original copy from 1977 and is in great condition. Check it out at http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=304654464

I'm not sure why everyone's so down on Sound Tracker. Most of the people that trash it probably have never used it and are only parroting others.

It is just some type of noise filter. It has a button to control it. If you don't like it just don't push the button. Hams & SWLers spend a lot of money to get noise filters. I have hundreds tied up in Timewave and NIR-10 filters for each of my communications receivers.

Why many CBers think a CB should not have a noise canceling filter I have no idea. The ST system does nothing but improve the signal to noise ratio. Something I would think most people would want. Then again, if you don't want it just don't push the button.

To be honest, I don't use it very often on my CB. I forget it is there and forget to push the button or it is engaged and I forget for days to turn it off. I think you will find it doesn't affect the "workings" of your radio one way or another if you choose not to use it.

People hate it because it is new and they don't have it yet (when they finally do get it they will justify the purchase with the standard song and dance, "the first one's sucked but the later ones are ok!")

1046. Hy-Gain Antenna Manuals

Newsgroup: rec.radio.cb
Date: 2000-04-09 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <38F0C5D6.5D226F17@qnet.com>
Source record: 30446

Hello All: I asked for a assembly instruction manual for a old HY-Gain Big Gun II, and the Stacked 5 element Yagi beam antennas. On the NG a few days ago. Well nobody answered, probably because these manuals are pretty rare. Or the guys who have don't want to share, or they don't like me.

Well MFJ who bought out Telex, (who bought out Hy-Gain) now offers the old CB Antennas Assembly Instructions, for only 5 dollars, a good deal. I got the manuals I wanted in premium shape.

So if you have a old Hy-Gain antenna and need the assembly instructions, here's the phone number for MFJ in Mississippi 622-323 9538

Jay in the Great Mojave Desert, just down the road ah ways from the fillin station. Where ah gettin ah freeway off ramp next year, so's you don't have to go all the way into Barstow just fer the freeway comin back. But ya stills got to drive down the steep inbackment ta get on.

I'm trying to come up with a cheap way for my Wife, Mother in Law (Lizard) and Daughter, who live about a maximum of Three blocks apart to talk when they need to without all the garbage of AM. I will use the ratshit back of set antennas, and was thinking that if there are any FM CB's that are not to expensive that they may help to reduce some of the AM garbage. I run my own SSB Mobil, and this has nothing to do with me, this is for Three people who don't know or care anything about radio (but may get interested?). So I think that with a back of set ant. and no power they should not bother anybody, and I was thinking with FM there would be less of a chance of them being bothered. I don't think there are anymore cheap 40 ch radios that can be dropped below ch. 1 anymore or I would do that. That is another idea, are there any cheapo AM radios that can have lower freq.s put in them like the old days? All my experience is with SSB and Export radios, have not touched a AM only radio since the 70's. Any ideas??

Hi,

I have a Cobra 23 plus I bought from Cobra about 2 years ago, used very little. I turned it on the other day and I get the weather channels, but no CB reception. The channel indicator is dead. Seems to transmit but on God knows what channel.

Can I get this fixed? Or should I buy something else?

I can't find Cobra on the internet. Where are they?

Thanks, Charles.

I don't agree.

Bird 43s are averaging RF voltmeters with scales
calibrated in RMS watts. They will perform their
function on any waveform they see (within the
confines of the particular slug).

Regarding: Secret CB Antenna
By : "Larry Diehl" <ldiehl@iname.com>

>How well do those "Secret CB Antenna" devices work? It's a little box that
>plugs inline and allows your regular car AM/FM antenna work for your CB as
>well...

Well, a friend of mine uses one in his minivan and says it's good for
several blocks. ;) Basically, this device plays with the resonanance of the
circuit and fools the radio into believing that it is transmitting into a
properly tuned antenna. Since your typical car antenna is designed for
frequencies roughly 3.6 times higher than CB, it cannot possibly be an
efficient radiator of the much lower CB frequencies.

In short, their main purpose is to keep you from frying your radio while
you feed frequencies to a radiator which was never designed for them. If you
only need very short-range transmission, then go ahead and use one, but short
range is all you can expect to get.

> confines of the particular slug).
snip

They will perform their function (reading the average wattage
accurately) only when the amplitude of the crest stays constant
as in a carrier.

They can not read accurately on any waveform. With a constant carrier
the 43's voltage measurement is calibrated to read the wattage. When
you start to modulate this carrier the 43 can not longer be calibrated
to read accurately. This occurs because of the square law of a power
increase as it relates to a corresponding voltage increase. In other
words if the 43 sees a legal 100% sine wave modulated A.M. signal it
will read it as 4 watts. This 4 watt measurement is erroneous.

The 43 can only average the voltage on the crest of the modulation.
The average voltage on this varying crest never changed so the 43's
power reading will never change either. The volt meter in the 43 has
no way to square the power increase with the increase of the voltage.
So in reality the 43 reads wrong and the modulated signal power does
change. It is now 6 watts.

I don't agree here either.

The 43 is claimed to be an RMS reading meter.

The 43 has a claimed accuracy, but Bird doesn't
guarantee it.

The 43 is considered the standard among many
high level CBers, but its accuracy is highly
debatable. Bird has recognized that and now
produces their "APM" (average power meter).

If you don't believe me, ask yourself the
following question: If the 43 was guaranteed
accurate when measuring average power (with
or without a specific load), why would Bird
need to come up with the APM?

Average power increases just as RMS; both can
be measured using thermal instruments. The
problem with thermal instruments is the time
required (they are slow to respond), and the
simple ones (like RF ammeters) lose accuracy
as the frequency of the test signal increases.

A true 4 watt (average power) CB signal will
increase to 6 watts at 100% modulation due to
the extra power contained in the sidebands.
Commonly available (and reasonably priced)
modern test equipment that would accurately
show that amounted to a scope and a spectrum

analyzer before the introduction of the APM
by Bird. On a 43 the same signal starts out
at about 5 watts (no modulation) and only
goes up to about 5.25 to 5.5 watts at 100%
modulation. At either extreme (no modulation
or 100% modulation) the reading is essentially
the same. In a nutshell, it's WRONG either way.

The 43 will show some figure regardless of
the shape (complexity) of the modulation
envelope. The point is that the figure
shown is neither average or RMS wattage--
it's "Bird watts." Don't try to relate
Bird watts to average, RMS, PEP, or peak
power because there is no solid relationship.
The only thing that can be said is that if
everyone were to use a Bird 43 then everyone's
measurements would be comparable (but inaccurate).
Unfortunately that's not the case.

The 43 is an averaging voltmeter.
It will come up with an average
RF voltage regardless of the shape
(complexity)of the input signal.
That voltage will show up on the
meter face as an "RMS" wattage.

> >RMS power readings are different than Average.
>

> power". In other words the real power averaged over a sufficiently
> long enough time period.

Mathmatically, there is no such thing as
"RMS" power. There is RMS voltage and
RMS current. Many people extrapolate
RMS power from the simple Ohm's Law
multiplication of RMS voltage and RMS
current. In the audio field the same
mistake is made.

I agree that average (or true heating)
power is the proper term.

> >The Bird meter is NOT an RMS reading meter, it is an AVG reading meter.
>

> voltage measurement of a varying waveform will not give a accurate
> account of the corresponding real wattage.

The 43 measures average RF voltage and then
tries to read out in RMS wattage. It was
going to be inaccurate from the very time
it was conceived. The original Bird
engineers knew that and accepted it. It
was the consistency (because of the slugs)
rather than the accuracy that they were
after. They did their job; the 43 design
is a hallmark of affordable consistency.

> >The only way to measure RMS power reliably is with a calorimeter.
>
> Or the Bird APM-16 electronic average reading wattmeter.It will give
> accurate readings with various different waveforms.

I agree.

For high-level CB use, the APM should be
the new standard.

> what is the easiest channel mod to do to this radio is it the expo 100 or
> something else that will give me more cchannels what are the mods any mods that
> just call for two switches

To get coverage from 26.815 to 28.045 (with a
few gaps) only requires two switches. The most
popular 148 mod is the two switch mod because
it's cheap (you can use front panel switches)
and easy (only requires the installation of
4 wires).

Here's how:

Install two SPST switches (or access two front
panel switches.

Use one switch to ground pin 10 of the PLL chip
(one wire to ground, one wire to pin 10).

Use the other switch to connect pins 11 and 12
together (one wire to pin 11, one wire to pin 12).

That's all there is to it. That's one of the
reasons the 148 remains such a popular radio.

> antenna. Why would it have to handle higher power if placed at the
> antenna? It isn't going to handle any more power there than at the
> output of the transmitter.
>

Here's the answer using a hypothetical example..

Transmitter --> Linear Amp --> Antenna

4 watts ------> 100 watts ----->

The power out of the transmitter is 4 watts. If you install the LPF there, then
it has to handle 4 watts.

The power out of the linear amplifier is 100 watts. If you install the LPF
there, then it has to handle 100 watts.

> as in a carrier.

That's not true.

The 43 isn't even an instrument designed to
display a true (heating) power reading. It's
just a tuned (because of the slugs) RF voltmeter
with a wattmeter scale. It will detect the
average RF voltage regardless of the amplitude
of the waveform. It has a rise and decay time
that will average out variations in the amp-
litude of the input signal.

> They can not read accurately on any waveform.

I agree with that.

> With a constant carrier
> the 43's voltage measurement is calibrated to read the wattage. When
> you start to modulate this carrier the 43 can not longer be calibrated
> to read accurately.

The 43 doesn't read accurately to begin with.
(See below)

> This occurs because of the square law of a power
> increase as it relates to a corresponding voltage increase. In other
> words if the 43 sees a legal 100% sine wave modulated A.M. signal it
> will read it as 4 watts. This 4 watt measurement is erroneous.

It's worse than that. The 43 won't even show the
4 watt fundamental (sine wave) signal accurately.

The 43 shows a true 4 watt signal to be a little
over 5 watts based on what it's designed to do.
Modulation has little effect on the 43's reading.

The 43 will see the averaged voltage and read it
out on its wattage scale--that's all it will do.

> The 43 can only average the voltage on the crest of the modulation.
> The average voltage on this varying crest never changed so the 43's
> power reading will never change either. The volt meter in the 43 has
> no way to square the power increase with the increase of the voltage.

I agree.

I don't know why you're arguing with me.

The 43 really doesn't even measure the crests
of a waveform--it's too slow--it sees an overall
average.

> So in reality the 43 reads wrong and the modulated signal power does
> change. It is now 6 watts.

The 43 neither sees the original 4 watts or the
modulated 6 watts; it reads out as about 5 watts
either way. It's absolutely wrong no matter how
you view it. Hopefully we can agree on that.

If you would have read my other posts, rather than
just the response to yours, you wouldn't have had
to write this at all.

Kenwood markets this radio worldwide, and has made orovisions to allow
the radio to transmit between 1.625 mhz and 29.999 mhz.
I am providing this modification for INFORMATIONAL PURPOSES ONLY! DO
NOT TRANSMIT OUT OF BAND, THIS WILL JEAPORDIZE YOUR LICENSE, AND HAVE
THE FCC, AND/OR INTERNATIONï¿½L AUTHORITIES KNOCKING AT YOUR DOOR!!!

The All-band transmit modificatï¿½on requires the removal and re-
location of a diode on the the digital board which is located behind
the front panel. The US version of the radio has diode D11 installed,
and diode D9 removed. D11 must be removed, and installed in the D9
position. This modification IS NOT for the faint of heart, as it
entails removing the front panel, and the digital board. Note that the
digitï¿½l board has solder holes thï¿½t are through-soldered; that is,
there are circuit traces on both sides of the board, so make sure that
ALL solder is removed from the holes. This modification will also
allow the antenna tuner to tune anywhere the receiver is tuned. This
modification should ONLY be performed ï¿½y those familiar with soldering
and de-soldering techniques, and requires patience, and dexterity.

i've been on the 11 meter freeband for years now and have yet to hear of any service thats being bothered by us.

>Snooty? I think any ham would be slightly concerned that rigs like these
>intended to transmit on a number of international ham bands (as well as
>commercial, military, emergency, and aeronautical frequencies) are now being
>aggressively marketed to unlicensed individuals.

these radios are for 11 meters not your precious ham bands. maybe you should worry about the terrible operating practices of the liscened operators before you worry about us pirates. like another poster mentioned a few days ago, well over half of the ham rigs sold by yaesu, kenwood, and icom sells to people without liscences. not too mention galaxy and all the other cheap bootleg stuff.

>In other words, people who have a total disregard for international radio
>agreements. People who can't be bothered to find out who's frequencies they
>may
>be transmitting on. People who take no responsibility for themselves or their
>actions.

just like people that try to make a problem when there really isnt one.

This works better but still not great if you canstill get it. Replace the auto antenna witha CB antenna. You use to be able to get a box that let you hook it up to the AM/FM. worked great on FM poorly on AM, so so on CB, probably as good as the cheap antenna would let it work anyway.

Remove the twelve screws holding on the bottom cover.
With the Radio laying flat on it's top remove the bottom cover. Turn
the radio so that the front panel is to
your left and the antenna connectors are to your right. Locate the IC
labeled "ICOM HD6433042SF".
About 3/4 of an inch to the right is a vertical row of diodes. The
left hand column of diodes has 7 diodes
(14 possible spaces). The right hand row is full with 14 diodes.
Remove the diode in the 6th space from
the top in the left hand column. DO NOT remove anything from the right
hand column. This should get
you TX from about 100KHZ to 60MHZ and 118MHZ to 176MMZ.

Not for the faint of heart??? This mod is a piece of cake and I have
practically no experience with such things.Reminds me of the post saying
the new 2950s couldn't be worked on because of the SMDs.
Where did you cut and paste this from(I already know)you should quote
your sources and give credit.

If you have a right to that callsighn you should know that FM is illegal on the CB band,you should also know that it wouldn't help your interferance problem a bit because when in the FM mode AM signals can be heard as well as when the AM mode.

1124. Kraco alignment data?

Newsgroup: rec.radio.cb
Date: 2000-04-10 00:00:00 UTC
From: Ghostlion@webtv.net
Message-ID: <5431-38F281C6-26@storefull-114.iap.bryant.webtv.net>
Source record: 30574

I had to replace a damaged final in a Kraco KB-2345 thanks to a shorted antenna. It now has lots of carrier and low audio. It looks like I need to do a re-alignment on this old beast. I have no service data for this radio so I don't know the function of the variable resistors on the circuit board. Could someone tell me which one adjusts the modulation? Is this information available online somewhere?

I stand by my original post (which you misunderstood).

You're right in assuming the 43 reads modulated signals
inaccurately. My original statement was designed to
convey the fact (to people in the know) that the 43 is
inaccurate regardless of the shape of the waveform.

It's too bad that reading between the lines has become
a lost art.

In the interest of fairness, I am pasting in portions a reply I made in private to AB7RS, who responded to both the NG and Email to my comments.

Start of pasted comments: ==============================

I get a bad taste in my mouth over the "Swing" mentality, and do my best to Elmer those locally who have technical promise into the ranks of ham radio. I attended a tailgate hamfest yesterday in which I took a S-15 Jimmy and Jeep Grand Cherokee packed full of home-brew oriented items, restored tube gear, military gear and test gear. All anyone wanted was turn-key HF product. Most of the attendees had General and above licenses. Few could grasp that a Jennings Vacuum Variable I was offering wasn't a tube. Of those grasping the concept, the numbers were equally divided into hams and 11 meter operators. I think the problem is in the internal structure and the availability of other modes of communications that are open to all comers. With the current refarming grant that the FCC has extended until 2002, the ham community will be lucky to retain the spectrum it already has allocated to it unless we increase our numbers. However, with the disdain that most have for changing technology, I don't see that happening.

FB on not including a disclaimer. I may not agree with all that you post, but I will give my last drop of blood in defense of your right to do so.

End of pasted comments ==

While we may not see eye to eye, we are still able to behave in a civilized manner and carry on communications. When you sit back and smoke it all over, you begin to realize that this is the essence of what it is all about; beit internet, HF, VHF, CB , the written or spoken word.

Put me down for a vote for FRS radios. Also with their portability, you can find other uses for them in the future. With 14 channels it would be very easy to set up a neighborhood watch, and still maintain "talk groups" without getting too overcrowded. Also, it will keep your rig freed up if they decide to become dedicated "Ratchet Jawers"

Addition to original response:

After reading subsequent posts by yourself I believe you are in more
or less agreement in the fact that the 43 can't read a modulated
signal properly. When you said "will perform their function on any
waveform" I assumed you meant accurately. I believe
now, after reading subsequent posts, that you mean the 43
will read any waveform as it was designed to. It was
designed with simplicity in mind, and will by this design read
inaccurately. So, if that is the case, then ignore my original
response below.

>They will perform their function (reading the average wattage
>accurately) only when the amplitude of the crest stays constant
>as in a carrier.
>
>They can not read accurately on any waveform. With a constant carrier

I have my Cobra 25 LTD Classic CB Radio forsale. It is a 40 channel CB, and comes with all the stuff that was in the box when it was new. This radio is in excellent working condition. I used this CB when I was driving trucks long distance, and it did a fantastic job. Price is $35.00 total, and that includes shipping priority mail. Please contact me at wjack@freewwweb.com

Thanks,
Wayne O. Jackson
wjack@freewwweb.com

The TA truck stop in Ontario, California... Talk to Bill, if he's available. Excellent tech, and he won't do you wrong. Prices are good, too.

Hope this helps.

Source record: 30611

For sale: Cobra CAM-88 tube-type 23 channel a-m base station. Powers up okay, receives well, indicates transmit power and modulation on my power meter. Seems to be in decent shape. Needs some light cleaning, but is overall in good shape. I haven't checked the tubes (my tube tester is on the fritz!). May need alignment. This is an estate item. Comes with its original Astatic hand mic and original B&K power cord. Price $30.00 plus shipping. Will be carefully packed for shipment.

Dual antennas do exactly one thing... Make your receive and transmit directional.... That is IF you can get the SWR's tuned properly, etc.

One antenna is superior to two, unless you're looking for a tuning headache, and you want to be directional...

But then again, what the hell do I know? I'm just a dumb ol' truck driver.

1153. Joke of da day

Newsgroup: rec.radio.cb
Date: 2000-04-10 00:00:00 UTC
From: Prozac <Prozac@BayshoreNetwork.Com>
Message-ID: <eUII4.49538$S4.354361@news1.rdc1.nj.home.com>
Source record: 30619

A blonde guy gets home early from work and hears strange noises coming from the bedroom. He rushes upstairs to find his wife naked on the bed,
sweating and panting.

"What's up?" he says. "I'm having a heart attack," cries the woman.

He rushes downstairs to grab the phone, but just as he's dialing, his 4-year-old son comes up and says, "Daddy! Daddy! Uncle Ted's hiding in your closet and he's got no clothes on!" The guy slams the phone down and
storms upstairs into the bedroom, past his screaming wife, and rips open the
wardrobe door. Sure enough, there is his brother, totally naked, cowering on the closet floor.

You rotten bastard, "says the husband, 'my wife's having a heart attack and you're running around naked scaring the kids!!!

The expo only uses one 3 position knob as to if you modify the pll you would use 2 switches. Different people use different methods in modifying there radios. I use a 2 switch method that gives more channels than the expo can. If you want more info, e-mail me and I will send you the mods I use for this radio. If your in the N. California area, I do all the mods for this rig for only $30.00 out the door. This includes: Unlocked Clarifier, Channel Expansion, ALC, and re-allignment of TX & RX. Other mods are available for slightly more.

They should. If you know 2 of the local hams with 70cm Ht's, ask them for a trial. Yaesu VX-1Rs would approximate the power output of the average FRS radio, and the 70cm (440 - 450 MHz) band is close enough that the comparison will be valid. The ham 70 cm HTs have wider deviation, from what I have gathered, but that should be the only real difference when using a ham ht at that power level for testing.

Does anyone own a Ghostrider amplifier? If you do, do you have TVI or RFI problems? I know someone who owns an X-Force 612 HD and he says he has no trouble with any kind of interference. Who else owns a Solid State amp and have you had any problems. I'm sorry I keep repeating the question, I just need some more info so I can make the right decision.
Thank you all for being
patient.
Steve

you would be best off buying them some galaxy 33's to use for about the same price as frs units. they have enough freq range to get away from most others and there cheap little units that will do the trick just nicely. ive never been a fan of back-of-set antennas but for what your trying to do you could mount a small mobile antenna on the gutter or something.

<< i wonder how all the snooty hams will like this. two new radios designed with the freeband sidebander in mind. >>

Snooty? I think any ham would be slightly concerned that rigs like these intended to transmit on a number of international ham bands (as well as commercial, military, emergency, and aeronautical frequencies) are now being aggressively marketed to unlicensed individuals.

<<these arent made for people that only use am
on one channel but instead for the real dx'ers that like talking world wide on a lot of different freqs. >>

In other words, people who have a total disregard for international radio agreements. People who can't be bothered to find out who's frequencies they may be transmitting on. People who take no responsibility for themselves or their actions.

Yes, I agree. Perfect radio for them. But what about the rest of us?

You don't just pay for the parts, but the design time, the manufacturing cost, the advertising, the time it takes to compose the documentation, the projected telephone time for product support, and all the other costs required to bring a product to market. Yes, you can build your own much cheaper. But that does not mean the other guy is "ripping people off". Only a socialist would believe crap like that. How much do you charge to align a radio? By your reasoning it should be free. After all, the parts don't cost anything. So think twice before popping your fucking mouth off about "rip off's".

The real purpose of dual antennas is to even up the radiation pattern. When an antenna is mounted on the mirror of a simi the groud plane offered by the cab is none too good and causes a really distorted radiation pattern. Dual antennas was suppose to make it more symetrical but I think most people use them because they think they look cool.

First a dumb question for the group. What are swing mods? Years ago (over 20) I was using a Yaseu 101-E for 11 meters. Now I am interested in getting back into the swing of things but l know nothing about the radios that are out and the 'mods' that are out there. Can someone help out a poor 'ol-timer here. I am looking in to getting either the Galaxy 88 or the RCI 2970. I will be using it mostly on SSB but also some on the AM side of the world. Clean talking and no drift is important to me...nothing worse than trying to track down the person who you are trying to talk with in my book. Still have the ol 101E just aint used it for a long time. But I would like to have a mobile that can 'keep up' with it...

Thanks

Before the

Federal Communications Commission

Washington, D.C. 20554

In the Matter of)
)
Leonard D. Martin)
File No. 98-HU-147)
Houston, TX)

NAL/Acct.No. X3254-003

NOTICE OF APPARENT LIABILITY FOR FORFEITURE

Released: March 3, 2000

By the Enforcement Bureau, Houston Office:

I. INTRODUCTION

In this Notice of Apparent Liability for Forfeiture, we find that Leonard D. Martin apparently violated Section 301 of the Communications Act of 1934 ("Act"), as amended, by operating an unlicensed radio station without Commission authorization; and Section 303(n) of the Act, by failing to allow inspection of his radio station. We conclude that Leonard D. Martin is apparently liable for a forfeiture in the amount of seventeen thousand dollars ($17,000).

II. BACKGROUND

In May, 1998, the Commission received a written complaint from an Amateur Radio operator asserting that an Amateur Radio station identifying with the callsign KC5WHN operated on unauthorized frequencies. On November 3, 1998, the Legal Advisor for Enforcement, Compliance and Information Bureau, sent a letter to Leonard D. Martin, licensee of record of Amateur Radio station KC5WHN. The letter advised Martin of complaints received by the Commission alleging that he operated on unauthorized frequencies. In response to the letter, Martin telephoned the CIB Legal Advisor for Enforcement and generally denied the alleged unauthorized operation.

On February 27, 1999, a Commission agent, using a mobile automatic direction finding ("MADF") vehicle, observed voice radio transmissions on the frequencies 27.545 and 27.535 MHz. The frequency 27.545 MHz is allocated exclusively to radio stations of the United States

government. The frequency 27.535 MHz is allocated exclusively to radio stations licensed in the Industrial Radio Service. The radio station did not identify itself, but responded to the name "Leonard." The agent determined that the source of the transmissions was an antenna on the residence at 4415 Spellman, Houston, Texas, the address listed on Martin's Amateur Radio license. There was no evidence of a Commission authorization for this operation.

On March 15, 1999, a Commission agent, using a MADF vehicle, observed voice radio transmissions on 27.370 MHz, a frequency allocated as a "guard" frequency between channels in the Citizens Band Radio Service. The station identified with the name "Leonard." The agent determined that the source of the transmissions was a vertical antenna on the residence at 4415 Spellman, Houston, Texas, the address listed on Martin's Amateur Radio license. Immediately thereafter, the agent knocked on the door of the residence and was met by Martin. The agent requested to inspect the radio station inside the residence, and Martin refused. The agent advised Martin that his operation on 27.545 and 27.535 MHz constituted unlicensed operation in violation of Section 301 of the Act, because Martin had no Commission authorization to operate on those frequencies. The agent also advised Martin that his refusal to allow inspection constituted violation of Section 303(n) of the Act.

On April 2, 1999, the Commission's Houston Office issued to Martin an Official Notice of Violation for operation of his Amateur Radio station in violation of Sections 301 and 303(n) of the Act. On April 8, 1999, the Houston Office received a letter from Martin in response to the Official Notice of Violation. In the letter, Martin stated "I now fully understand that operation on the frequencies outlined is a violation," "that the FCC has the authority to inspect all radio installations." and "I promise no further action by the Commission will be necessary to insure my complete compliance with the FCC Rules."

On July 22, 1999, Martin submitted to CIB Legal Advisor for Enforcement his Amateur Radio license for cancellation. On July 23, 1999, CIB Legal Advisor for Enforcement sent Martin a letter acknowledging receipt of the license and confirming that Martin's Amateur Radio license KC5WHN was cancelled effective July 23, 1999. The letter also warned Martin that unlicensed radio operation would constitute violation of Section 301 of the Act.

On October 19, 1999, the Commission's Houston Office received a complaint from a neighbor of Martin's that Martin's radio operation was continuing to cause interference to electronic equipment in their home. That same day, a Commission agent, using a MADF vehicle, observed voice radio transmissions on 27.535 MHz, a frequency allocated exclusively to licensed stations of the Industrial Radio Service. The agent determined that the source of the transmissions was a vertical antenna on the residence at 4415 Spellman, Houston, Texas, Martin's residence. Immediately thereafter, the agent visited the neighbor complaining of

radio interference and observed interference on the neighbor's telephone.

On October 26, 1999, a Commission agent, using a MADF vehicle, observed voice radio transmissions on 27.455 MHz, a frequency allocated exclusively to licensed stations in the Industrial Radio Service. The agent determined that the source of the transmissions was a vertical antenna on the residence at 4415 Spellman, Houston, Texas, Martin's residence. There was no evidence of a Commission authorization for this operation. Immediately thereafter, the agent knocked on the door of the residence and was met by Martin. The agent requested to inspect the radio station inside the residence, and Martin refused. Martin stated that he believed he was being unfairly targeted for enforcement because there were many other operators that transmitted on unauthorized frequencies.

III. DISCUSSION

Section 301 of the Act sets forth generally that no person shall use or operate any apparatus for the transmission of energy of communications or signals by radio within the United States except under and in accordance with the Act and with a license. Section 303(n) of the Act sets forth the Commission's authority to inspect all radio installations associated with stations required to be licensed by, or subject to the provisions of, any Act, in order to ascertain whether they conform to the provisions of any Act.

Based on the evidence before us, we find that on February 27, October 19, and October 26, 1999, Leonard D. Martin repeatedly and willfully violated Section 301 of the Act by operating radio transmission apparatus without a Commission authorization. We also find that on March 15 and October 26, 1999, Leonard D. Martin repeatedly and willfully violated Section 303(n) of the Act by refusing to allow an inspection of his radio station upon reasonable request by an authorized Commission representative.

Pursuant to The Commission's Forfeiture Policy Statement and Amendment of Section 1.80 of the Rules to Incorporate the Forfeiture Guidelines ("Forfeiture Policy Statement"), the base forfeiture amounts are $10,000 for unlicensed operation and $7000 for failure to allow inspection. In assessing the monetary forfeiture amount, we must also take into account the statutory factors set forth in Section 503(b)(2)(D) of the Act, which include the nature, circumstances, extent, and gravity of the violation(s), and with respect to the violator, the degree of culpability, any history of prior offenses, ability to pay, and other such matters as justice may require. Martin's violations were repeated and willful, and resulted in harm in the form of electronic interference to neighbors' home electronic equipment. Martin was advised of these violations numerous times, both orally and in writing, by Commission representatives and Martin indicated that he fully understood the requirements of the Act. Martin repeated the violations

after receiving these warnings. Applying the Forfeiture Policy Statement and statutory factors to the instant case, a $17,000 forfeiture is warranted.

IV. ORDERING CLAUSES

Accordingly, IT IS ORDERED THAT, pursuant to Section 503(b) of the Act, and Sections 0.111, 0.311 and 1.80 of the Commission's Rules, Leonard D. Martin is hereby NOTIFIED of his APPARENT LIABILITY FOR A FORFEITURE in the amount of seventeen thousand dollars ($17,000) for violating Section 301 of the Act and Section 303(n) of the Act.

IT IS FURTHER ORDERED THAT, pursuant to Section 1.80 of the Commission's Rules, within thirty days of the release date of this NOTICE OF APPARENT LIABILITY, Leonard D. Martin SHALL PAY the full amount of the proposed forfeiture or SHALL FILE a written statement seeking reduction or cancellation of the proposed forfeiture.

Payment of the forfeiture may be made by credit card through the Commission's Credit and Debt Management Center at (202) 418-1995 or by mailing a check or similar instrument, payable to the order of the Federal Communications Commission, to the Forfeiture Collection Section, Finance Branch, Federal Communications Commission, P.O. Box 73482, Chicago, Illinois 60673-7482. The payment should note the NAL/Acct. No. X3254-003.

The response if any must be mailed to Office of the Secretary, Federal Communications Commission, 445 12th Street, S.W., Washington, D.C. 20554, ATTN: Enforcement Bureau • TPSD, NAL/Acct. No. X3254-003, and must include the NAL/Acct. No. X3254-003.

The Commission will not consider reducing or canceling a forfeiture in response to a claim of inability to pay unless the petitioner submits: (1) federal tax returns for the most recent three-year period; (2) financial statements prepared according to generally accepted accounting practices; or (3) some other reliable and objective documentation that accurately reflects the petitioner•s current financial status. Any claim of inability to pay must specifically identify the basis for the claim by reference to the financial documentation submitted.

Requests for payment of the full amount of this Notice of Apparent Liability under an installment plan should be sent to: Chief, Credit and Debt Management Center, 445 12th Street, S.W., Washington, D.C. 20554.

IT IS FURTHER ORDERED THAT a copy of this NOTICE OF APPARENT LIABILITY shall be sent by Certified Mail Return Receipt Requested to Leonard D. Martin at 4415 Spellman, Houston, Texas 77035.

FEDERAL COMMUNICATIONS COMMISSION

Loyd P. Perry

Resident Agent, Houston Office, Enforcement Bureau

Subject: The down side of cosmetic surgery

A middle aged woman had a heart attack and was taken to the hospital. While on the operating table she had a near death experience. Seeing God, she asked if this was it. God said, "No you have another 43 years, 2 months, and 8 days to live."

Upon recovery the woman decided to stay in the hospital and have a face

lift, liposuction, breast augmentation, tummy tuck, etc. She even had someone come in and change her hair color, figuring since she had so much more time to live, she might as well make the most of it.

She got out of the hospital after the last operation and while crossing

the street was killed by an ambulance speeding to the hospital.

Arriving in front of God, she demanded, "I thought you said I had another 40 Years?"

God replied,"I didn't recognize you."

So, lets see if we understand this situation. You call a store
to get free technical information and a free radio appraisal,
and then you're upset that they wont give you the time of day?

Did you ever stop and think that maybe, just maybe, AES answers
the phone with the intent to make a sale and an eventual
profit?.......After all, they are a business. They didnt shell
out hundreds of thousands of dollars to get into business to
answer your "free-bee" questions.

You should consider yourself lucky that they dont sue you for
slander and/or libel as a result of your posting.

It has EVERYTHING to do with right or wrong. Most of the free-banders I know are quite aware of the law and if necessary, willing to pay the piper, should it come to that. The analogy you presented alluding to the mindset that "someone would rob you if they could get away with it" is pure hogwash when comparing it to free-banders. Only those causing wanton, malicious, and willful interference and splattering the spectrum with way too much wattage seem to be the ones getting popped anyway, and that is usually after at least a warning. Many of these free-banders are concise, polite, and willing to take actions of correct measures to stop UNINTENTIONAL interference. But to concede that this somehow makes an individual susceptible to a life of crime speaks volumes of your comprehension of any pseudo-psychological analytical insight that you may profess to possess.

You have a solid idea...going above or below the standard 40 channels and using FM is a good plan. You will have short transmitt and receive range, but more than enough for your needs, reducing the chances that they will be harrassed or bothered by the garbage and trashy people that are a part of 11 meters.

Skip reception will be very light with back of the set antennas. People will not be able to listen to their transmissions from more than a mile away or so either. I used to use one...first antenna i ever had, $9.95 at Radio Shack. From in the house, i could not talk to someone 1.5 miles away, at 1 mile they could hear me but not really make out what i was saying very well.

However, from 1/4 or 1/3 of a mile you will have a very good signal.

If they develope an interest in radios they can start talking to others on the standard 40 channels if they so choose later on.

You shouldn't disagree, because the figures are accurate. In fact, my numbers are fairly conservative.

It's this simple. There are 745.7 watts per horsepower. I rounded it to 750 watts for convenience. That's physics. 750 watts = 1 hp.

Most likely the motor RPM drops when you're at idle and key the transmitter. That's because there's a fixed fuel flow scheduled at idle with non-fuel-injected, non-computer-controlled engines. Even some engines that are fuel injected and computer controlled will still schedule, i.e., demand fixed fuel flow at idle. That means they on an open loop schedule vs. a closed loop control.

It only takes about one horsepower to idle the engine. If the fuel flow is sufficient for only one horsepower, then what do you think is going to happen when you demand one additional horsepower from for the heavily loaded alternator? Hint: Engine dies.

> Good luck.
> Jeff

I can't see why you'd need 5 HP if the 2400 watt amp required 3.2 HP. If the conversion was 90% efficient, which seems reasonable, then you'd require 3.6 HP to supply the alternator. (Wow, you guys run big amps!)

Has anyone realized that about 40 percent of even the best alternator's energy is dissipated as heat and never gets used to charge the battery? Take that into consideration.

Aboard our cargo ships we routinely get around 100 miles nautical
coverage out of our 25 watt Sailor VHF marine radios while at sea. The
antenna is a 5/8 vertical at about 130 feet.

Since I'm also a ham I also found the same coverage on 2 meters with a
similar antenna and power.

Thanks for reading.

Looking for the older Lafayette Comstat series of CB radios. Or any Lafayette items. What do you have sitting around. Please state condition and price if possible.

Thank you,

Peter

Rather than bore us with an illiterate diatribe, why don't you simply call the store and - politley - ask to speak with the manager? Better yet, ask for his name and write a POLITE note expressing your concern. That would seem the proper course of action, instead of rashly bashing all of AES with an emotional appeal to a bunch of CB'ers who really have no clout with AES to begin with.

>Try dealing with these CLOWNS!

That's right, everyone at AES must be a clown. Wrong.

>heat up I think this is a good measurement of horse power it takes per
>alt.
>73 to all,
>Bean

When I went to tech school for diesel repair, they taught us that, ON PAPER,

760 WATTS = 1 HP.

12 V @ 12 WATTS = 1AMP

200AMPS X 12 WATTS = 2400 WATTS

2400 WATTS / 760 WATTS, (1 HP), = 3.1578 HP.

Keep in mind that this doesn't allow for mechanical drag of bearings in the engine driving the alternator or the bearings in the alternator itself or power losses from the drive belt, pulley assembly.

I think it would be safe to say that a minimum of 5 HP would drive the alternator at maximum but, in a case like this, more would be better.
Good luck.
Jeff

That is the only way they can feel "big" as this type that enjoyes being illegal has the mentality of a 12 year old. They are only "big" in the eyes of other of "big man" illegal types, those whose IQ is equal to about half their age.

I never said I didn't break any laws, very few people can actually lay claim to that. Most aren't quite as ignorant as you are, breaking laws and then bragging about it. It does make me feel superior to down ignorant law breakers like you. You are very much in the minority when it comes to CB'ers. To bad the image you show to most people is the one that most CB'ers are judged by. So your illegal activity and then bragging should cause most CB'ers to be concerned, because it does effect them. As for trying to stop all kids from smoking pot, Yes I do. You don't? Maybe thats part of your problem, you sound like you really don't know the difference between right and wrong do you?

ps, you make think your a big man, but you still sound like a smurf.

Hi;
Has anyone bought a product from DC Linears? They make Ghostrider amps.
I've only heard from 1 person and would like to hear from anyone who did
business with them? I'm interested in their Ghostrider 2000 and need info on
company. If you know of anyone please have them e-mail me.
Thank
you in advance!

Steve

When your illegal activities affect others, then Cb'ers should worry.
You can't be that foolish to think you can run all kinds of power,
operate out of band and then come in here and brag about it and not
affect anyone? Sounds like you are the one with no life. Hey another
couple of years you will hopefully grow out of the childish phase.

the leagal/illegal aspect of our hobby is rarely brought into consideration except when a ham brings it up to show "how wrong we are". we talk and have fun. we'll leave the operating by a list of rules and regulations to those that have chosen to do so. if we wanted it like that we would have gotten our tickets and be reading the rule books right now. until then we will continue to talk and have a good time withoiut worring what the next guy will think about what we said.

Major snipage

Who gives a fuck Jeff. Why do you think that when you post to a CB newsgroup this crap, that we give a shit. I mean really Jeff, all you're trying to do is cause
discontent among cb'rs against ham operators. I can bet you if I posted some crap on the ham newsgroups about Keydowns and illegal amps that ham operators
are selling, or something along those lines, they would start buzzing like bee's
about that crap.
Give it a rest, shit, you've got far to much time on your hands if this is fun for
you to cause shit over a ham operator operating out of band, then posting his
capture on a CB Newsgroup. Post it on the ham newsgroup, no the CB newsgroup.

The Landshark

<< the leagal/illegal aspect of our hobby is rarely brought into consideration except when a ham brings it up to show "how wrong we are". >>

They do not bring up this subject because they enjoy telling others about laws and rules. They bring it up because many laws and rules (in this case, frequency allocations and RF power limits) are there to protect other people's rights from being trampled. You seem incapable of grasping the concept of "other people's rights". You seem only able to see things in terms of "me me me".

It is a childish view that one's actions do not affect anybody, or that any law originating from the government must be wrong and therefore worthy of ignoring. The looter mentality ("it's only illegal if you get caught") embraced by freebanders is a sad thing to behold indeed. When you ignore the laws you (in effect) are saying that you think that you are more important than other people.

Eddie,
Same problem for most of the 'newer' vehicles, and
the answer is also about the same. Run power leads
to the battery(both), run a ground strap to ANT ground
you can find, run ALL leads (power & ant.) as far away
from any 'computer module', as you can possibly get.
I don't know about the Sonoma, but if it has an 'in-the-
fueltank' fuel pump, get ready to 'by-pass' it with a
capacitor to get rid of the noise (see GM notice).

Hamm',
It's not the crystals, it's the design of the thing. "Zero-beating"
isn't an 'instinctive' operation and most Eagle operators can't do it
as exactly as a 'tracking' transceiver can. Crystals are about like
transisters in that they either work, or they don't. Can't wear one
out.

1245. SSB Frequency 11 meters

Newsgroup: rec.radio.cb
Date: 2000-04-11 00:00:00 UTC
From: radiocity@my-deja.com
Message-ID: <8d0cgnpip1@nnrp1.deja.com>
Source record: 30728

Hello radio hobbiests just some tips for newbies on 11 meters.
As a dealer since 1989 we sell all over the world on the internet
and off cb radio,10 meter,shortwave,and scanners.
But for cbers or 11 meter operators these are the rules we follow
1.) educate your customers on what modes and frequencies are used
for on 11 meters we educate our customers to use am on 1-34,and
ssb modes from 35 thru 40,if on am know your 10-codes,if on ssb know
your q-codes and just use plain english or whatever country you live
in the home countries form of speaking.
3.)The most important thing to remember is respect for all the men and
women young and old who have cb radio or 11 meter equipment.
Remember these radio we as dealers sell are not toys but as states
communication equipment.
We cannot stop someone from misuse of there radios but we as dealers
in the usa and elsewhere need to take an interest besides making
buck to educate all new and even old operators what 11 meter frequencies
are to be used for what.
There is the freeband which i realize people will buy equipment to use
above 40 for dxing around the world this has not yet be leagalized by
our fcc ,but 95 percent enjoy dxing and belong to international dx
groups around the world who are good radio operators.
As a dealer we hope everyone enjoys and uses there equipment in the
right ways.
So remember the three most important area and you will have many fun
times meeting people from around the world ,national and even locally
who have a serious interest in 11 meter communication am/fm and ssb.
If you are looking for new non-returned,factory fresh equipment
just contact radiocitycomm@hotmail.com your serious online store
for all your 10 and 11 meter,shortwave and scanner needs.

Sent via Deja.com http://www.deja.com/

That is why the hams don't want these kind to become hams, if they have
no regard for rules or regulations concerning cb, then they will have
the same dis-regard for the rules on the ham bands. They already have
enough of that type of mentality on the ham bands without adding more.
These kind of people have no regard for anyone else, as you say it is
all "me, me, me...I'm the only one that counts". Take their age, divide
it in half and you have their IQ.

There is you answer to the mentality of this type. It has nothing to do with what is right or wrong (they can't seem to tell the difference), it is simply can I get by with it. He would think it perfectly OK to rob you if there were no fear of punishment. They work on the order of animals such a a monkey. You can train a monkey to do many things based upon reward and/or punishment. A monkey can be trained not to do something bad by knowing he will be punished if he does, it has nothing to do with knowing right or wrong.

Message-ID: <8d0fgjdlv1@slb1.atl.mindspring.net>
Source record: 30740

I would like to repair a 2510 that was in a fire. While not directly in the flames, it was near enough that the front plastic bezel, knobs and pushbuttons were distorted and warped from heat. I have also pulled the processor to "update" a 2600. At a minimum, I need the front plastic pieces and processor chip. Easier than that, the front control assembly and the processor board. A good stock Mic would be nice also. Entire radio (as long as processor and front plastic is good) will be fine also.

Also, always searching for info on a A.R.F. Products, Inc. ARF2001 Scanning Transceiver, and for info on the DTI (Digital Tuning Interface) project for computer control of PLL rigs.

Thanks,

David

1262. Schematics for Palomar Elite 400

Newsgroup: rec.radio.cb
Date: 2000-04-11 00:00:00 UTC
From: "Christopher G. Petty" <sideband@cac.net>
Message-ID: <38F3C8B4.49C971CA@cac.net>
Source record: 30745

I'm looking for schematics for a Palomar Elite 400, or rather the Palomar amp which is all black, with the heatsink on the bottom, 3 switches, 3 LED's, and a big white number 4 in the upper left corner of the face.

Barring schematics, I'm wondering if anyone knows the conversion for this amp to add a direct key from an output on a transmitter.

Any help would be greatly appreciated.

If you're only getting 12 watts swing on AM on a 148, you're not doing something right... I've gotten 17-19 watts on every 148 and Grant XL I've ever worked on.

Pull R 131, leave TR24 alone, turn the carrier up, and tune for max output on deadkey. Turn the carrier down to 2 watts and watch it swing like mad.

Hope this helps.

-CGP

More than likely, the tendency to kill the motor isn't due to the horsepower drag. It's probably due to the power use taking current from the coil(s) for ignition. Drop that current, and the cylinders don't fire as efficiently, and the motor will bog down. Add another alternator or some 1 farad caps at the supply points close to the amp(s) or another couple of batteries.

How can I make one of the late model 148's "SWING"
I got one and all I can get out of it is 4 watts key and swing 8, surely
there is some way to get 4 watts key and swing 15.

What ever happened to the Golden Eagle transceiver of the mid 70's? I was a skip-shooter back in the day, but I've been out of it for a while. I seen this newsgroup and it got me thinking. I still have a Midland 13-883 with the volume on the mic and one of the first 40 channel with sideband radios the radio shack came out with when they bumped from 23 channels to 40 channels. I used a Starduster omni-directional for general use and a three element beam with a 9 db gain from radio shack. I really wanted a Golden Eagle but I just couldn't afford it. Those were the days.

Thanks

: I agree.

Unless I misremember Bird's own pamphlet on the meter, both Bird and I
disagree. It will read an unmodulated power level accurately, and may
do so with a carrier modulated with a single tone (I don't recall). But
it is not accurate for any other waveform (including two tone modulation).
It IS far more accurate than the 43.

I have. It means that the radio and microphone cord are acting as part of
the antenna system.

It usually means that either the radio or the antenna is not properly
grounded. It is also possible that the coax is defective - but this is
a lower probability.

So zz.....what you're saying is that it's ok to charge $15.00 for a single resistor and a few wires that don't connect to anything. Ok, let the buyer beware. I'm sure a lot of product testing and development went into this "supermod kit." Kudo's to those taking the time and expense to expose the ripoffs out there.

I wonder how you'd feel if you bought a transceiver (for $200.00) with a bunch of switches and dials only to find out that aside from the power/volume control, channel selector, and squelch control, nothing else was connected.

I could be wrong but I think the above analogy was the point.

Source record: 30768

don't know about the bird but most meters will read high when
there is a high SWR present. thats why its hard to get a
accurate reading when looking into an antenna...
when you clip the limiter and peak "balls to the wall" the rig
will blow out alot of harmonics, and the watt meter see's these
also. they have a high SWR so the meter reads high. therefore
when the carrier is modulated the meter will show a large amount
of forward swing....which is usually a lie.

damn, thats the most i've said in a long time. gonna set down
and catchkmy breath..

dave
always use a dummie load.

if thats important then leave the galaxies alone. they drift like a siltronix and dont sound good on ssb and the 2950 lacks any real channel rejection. find you a 2510 or buy a new lincoln for real ssb work.

>Clean
>talking and no drift is important to me...nothing worse than trying to track
>down the person who you are trying to talk with in my book.

An engine at idle is not putting out a lot of horsepower so it does not take much to load it down. Idealy an engine set up to generate power should have a govenor on it to keep it at a constant speed rgardless of the load. Cars and trucks aren't setup to do this.

klakky,
Unfortunately, the 'Eagles' are still around. In their
day they were pretty good radios. Now, they're just a
'pain' for everyone to put up with, encluding the owners.
Probably be nice to have one setting on the shelf, but
certainly not in the same 'class' as the modern redios.
'Doc

1305. Leece / Electrodyne

Newsgroup: rec.radio.cb
Date: 2000-04-11 00:00:00 UTC
From: phil <phil@invest.fsbusiness.co.uk>
Message-ID: <nhzX6NAMI084Ew$1@invest.fsbusiness.co.uk>
Source record: 30788

I'll be in OH for a couple of weeks in mid May.

Can any one recommend a wholesale supplier or reliable and honest re-builder of either of the above alternators 75 or so miles radius of Dayton or Cincinnati?

I'd like to bring back a 2200 series (325A) Leece or E-350A Electrodyne. If a rebuilt unit I will not be able to supply a core so expect to pay a small premium.

However, I don't wish to go to crazy with cost.

The big Leece's are, I believe the same wholesale net in the US as they are here in the UK at around 1500 bucks.

And that is the one off 'Brand New', not re-built price to dealers!

Any contacts anyone or do you have a spare you'd be prepared to part with?

Many thanks

Phil / UK

Xtals for sale

Older RCA (large) type. not sure exactly how many, but a handful at least.
Not sure of the "working" condition. Can test for basic function.
AS IS, make offer. Shipping is extra

Anyone interested? E-mail me direct.

Thanks

Lou/Tech@DP.Net

Anybody out there got a mod for a late model 148 to make it swing like the
old ones???
All I have been able to get out of mine with 4 watts key is 6-8 watts swing.
All the older models that I have adjusted would swing about 12 watts on AM.
Thanks in Advance
Tony

Only someone with CB'er mentality could come up with a statement like
that. Some day before you reach puberty your mommy and daddy will
have taught you the difference between right and wrong. Just because
someone else does something wrong doesn't give you the right to also
do something wrong. Why not start growing up?

The poster stated "theres no reason to fear punishment so why not?"

Yes, there are many freebanders who are "concise, polite", but for
anyone who states "theres no reason to fear punishment so why not?" what
I said applies. If it were not for these types we wouldn't need laws and
punishment for breaking those laws. We have to have laws because there
are those who cannot be trusted to do what is right unless there is some
punishment for doing wrong, and anyone who makes the statement "theres
no reason to fear punishment so why not?" falls into that group.

Your id of "twistedhed" speaks volumns.

I just bought a little Cobra 19 Ultra for $3 at a yard sale for use as a spare mobile. I've seen a couple of sites that give the modulation limiter resistor and power pot adjustments for the Cobra 19, but each site lists different info. Does anyone know which resistor or VR pot is the modulation limiter and where is the AM power VR pot or coil for the Cobra 19 Ultra with the black plastic case and grey plastic front panel with orange and white lettering and accents? Thanks.

1330. Proposed rig

>the
>> range on them is their any skip on that band
>

Yes, there is occasionally skip. Most of the time, it results from temperature inversion; i.e., signals bouncing off air boundaries. On the amateur bands, it is a novelty to talke 300 to 500 miles. On the marine VHF, it is annoying and disruptive. Marine VHF communications is for specific purposes and is very localized in nature. While trying to navigate a harbor or signal the Pilot Boat, hearing signals from elsewhere is confusing.

The larger ships have antennas located 100 feet and higher above the waterline. Base stations have tower-mounted antennas. The communication range for these types of installations is better than the pleasure boater with an antenna just above the water. A handheld unit talking with another handheld will have a range of about five miles.

If you are not a boater but are thinking of purchasing VHF Marine equipment, get some education about channel use. The FCC, Coast Guard, and US Navy operate a sophisticated direction-finding network, linked together by instant communications 24-hours a day. They DO go after individuals causing harmful interference to shipping and boating interests. VHF signals are among the easiest to locate. A vehicle with a doppler RDF (that's the one with four identical antennas on the roof) can get a bearing on signals as short as one second. More than one deer hunter has been tracked by the Coast Guard Auxilliary! :)

Suit yourself. I met Riley Hollingsworth in person a few days ago. He said
that the standard fine for transmitting on the wrong frequency is $7,500.*

That could make radio a very expensive hobby. Might be cheaper to take up golf.
:)

QRM

*Most of the conversation dealt with amateur radio operations and enforcement.
However, there were some comments specifically about CB. I hope later to type
up a summary and post it here.

1337. Why These Enforcement Reports? (Was: $17,000 fine)

Source record: 30687

>
>the leagal/illegal aspect of our hobby is rarely brought into consideration
>except when a ham brings it up to show "how wrong we are".

On occasion, rec.radio.cb has a case of an amateur strutting in and waving his license. And he usually is met by such outrage by hams, CBers, and Ham/CBers that he quickly leaves with his tail tucked between his legs.

Meanwhile, there are individuals (some of whom are hams) who bring enforcement information to this newsgroup for educational purposes. Most CBers do not subscribe to a radio publication of any kind. Nor do they cruise the websites where enforcement actions are reported. It is easy to get the impression that there is nothing going on in this regard if you live and talk in a vacuum.

Ham Operators, through necessity, are in tune with what is happening at the FCC. So when they see a major shift in the enforcement climate and report it in this newsgroup, take it in the spirit in which it is offered. It's news that most participants in rec.radio.cb are not getting elsewhere.

I do not want to start a flame war, but here is my 2 cents.
I am a Manufacturers Rep. and I answer "free" calls all day long.
Who do you think these "free" calls contact when they need something else.
Me.
Even if they don`t contact me again they will give out my name as a contact to buy something. Yes it does work and it happens to me all of the time. You would be amazed at how many calls I get this way. It is a proven fact. I`ve been doing it for 8 years or so.
Never bad mouth your competition either.

If you don`t want to talk to people on the phone get another job.

So 2 years ago I went down to the store and bought a cobra 18wxst. Spare me the commie redchina BS......Is this radio just a piece of junk or what? I never see anything about it here on the ng. I am running a 102"whip with a 225 blue face (when I am doing expriments of course) and I was wondering if a different radio could possibly extend my range. I would like to make some long distance contacts and am not sure what I am doing wrong. Thank you for your tips in advance.

Subject: What's it all about?

The American investment banker was on the pier of a coastal Mexican village, when a small boat with just one fisherman docked. Inside the small boat were several yellow fin tuna. The American complimented the Mexican on the quality of his fish and asked how long it took to catchthem.

The Mexican replied, "Only a little while."

The American then asked why he didn't stay out longer and catch more fish.

The Mexican said he had enough to support his family's immediate needs.

The American then asked, "But what do you do with the rest of your time?"

The fisherman said, "I sleep late, fish a little, play with my children, take a siesta with my wife Maria, stroll into the village each evening where I sip wine and play guitar with my amigos. I have a full and busy life."

The American scoffed, "I am a Harvard MBA and could help you. You should spend more time fishing and with the proceeds, buy a bigger boat. With the proceeds from the bigger boat you would be able to buy several boats and eventually you would have a fleet of fishing boats. Instead of selling your catch to a middleman ,you would sell directly to the processor,eventually opening your own cannery. You would control the product, processing and distribution. You would then need to leave this small coastal fishing village and move to Mexico City, then to L.A. and eventually New York City where you would run your expanding enterprise."

The Mexican fisherman asked, "But how long would all this take?"

The American replied, "Fifteen to 20 years."

"But what then?"

The American laughed and said, "That's the best part. When the time is right you would announce an IPO and sell your company stock to the public and become very rich. You could make millions."

" Millions ... then what?"

The American replied, "Then you could retire. Move to a small coastal fishing village where you could sleep late, fish a little, play with your kids, take a siesta with your wife, stroll to the village in the evenings where you could sip wine and play your guitar with your amigos."

I just bought a new Astatic 636-L mike. I've noticed that I don't see as much "swing" on the meter of my Galaxy 55V with the 636 as I saw with the stock mike. Any input would be appreciated. I have a Doczy (not sure of the model #) and saw similar modulation readings between the two mikes.

You dont't zero beat the transmitter, thats the part that is crystal controled.
How could you tell their rx is off freq? And yes crystals change freq with age.
AS a matterof fact youcan get a pretty good ideaof how old a crystal is
bychecking its freq.

landshark863,
The question is, does the mic make you sound like
"you"? Is it 'good' audio? If the answer is yes, then
your mic is worth having. What little 'swing' you MAY
have lost probably would never be noticed if you don't
tell some one.
'Doc

The 462/467 mhz frequencies of the FRS units will allow them to penetrate the walls of houses and other obstructions much better than HF bands. I can talk to people a mile away from inside my house with a very good signal on my Midland FRS radio. Try a Ranger 1020...has all 14 channels, 38 ctcss codes and good loud audio. $39.95 at Wall Mart.

(From Websters) Criminal-One guilty of a crime or violation of the law, usually of a serious nature.
Please explain your position on how you can categorically place the average freebander as one who commits a serious crime. This is a serious crime to you? Utilizing your logic, one who infracts a law is a criminal? Does this include speeding? Making a u-turn when not permitted? Jaywalking? Drinking an alcoholic beverage in public? It is of little surprise you quote Nazis.

If you were going to be a nice, small compact CB unit (used or new) for mobile use, what would it be? Let's say under $150.

I like my little Uniden (seems to do the job) but I'm thinking maybe SSB holds more interest.

> some else. Thanks. Bill
==========
Bill,
MFJ makes several tuners that are small enough to be
used in a mobile. Probably several other manufacturors
do to. Any of them should work for what you want.
Of course, re-tuning the antenna for a good match is
a better solution. There are losses in using a tuner.
those losses may not be much, depending on the mismatch,
frequency, and the tuner. At 5 watts, i'd start worrying
on how much loss you may have with a tuner (really have
to be a high SWR for much loss).

TUBES AVAILABLE

I currently have over 300,000 tubes in stock. Have a good selection of both new and used/tested tubes for audio, CB & HAM radio, TV, CRT use.
Sorry I do not have a Web Site nor a price list. Suggest that you Email or Fax me with the tubes that you are looking for along with the quantify of each needed. I will check my inventory and advise you of current availability and cost.
In addition, I also have a very good selection of tube testers, tube caddies and good used CB/HAM equipment. Please contact me regarding your needs.
Thank you for your consideration.

1370. Re: Why These Enforcement Reports? (Was: $17,000 fine)

Newsgroup: rec.radio.cb
Date: 2000-04-12 00:00:00 UTC
From: The Landshark <Lndshark@ix.netcom.com>
Message-ID: <8d21sl$4tn$1@slb1.atl.mindspring.net>
Source record: 30851

While your statement is a correct one, there are some who post these
articles about "Ham Operators" being fined strictly for the inflammatory
value only. Most people already know that it is illegal to use an
amp, transmit out-of-band, but yet certain people feel the urge to post
such articles as the previous one about a Ham operator being fined,
on a CB newsgroup. When said articles are posted, they do that for
one reason and one only..... To start a long thread, and see how
much discontent they can create.
Owning an amp really isn't much different than putting a set of
headers and chip and such on your vehicle. The only real difference
is the amount of fine. I use this newsgroup and the motorcycle & truck
groups all the time, and this is the only one that has these individuals
coming in and starting this type of shit.
This hobby, is the only one, where another group of individuals feel
the
responsibility of governing others on the way the should use and work
their hobby. I never have people tell me to take my race performance
parts of my motorcycles or car's or trucks. I never have anyone post
anything about "DMV fines person $3.000 for race parts" Even though
it does happen.
My point is, we don't need these people doing this crap unless someone
specifically ask for this type of information.

Enough ranting,.,

Source record: 30854

Dave:

I've got a GrantXL set up to output +8V to an amp when the PTT is depressed. I just need to know which trace to cut in the amp to solder the wires and phono jack (switching type) to in order to key the amp when the radio is keyed.

Reason for this mod is that the RF detector in the amp sucks for SSB transmissions, so I want to direct-key it. When the direct key cable is plugged into the amp, it won't key without a d/c transceiver hooked up. When the cable isn't plugged in, the RF detector will work properly, and everything will be happy.

Got any ideas?

i think it is interesting that you can tell what others what i would think or do under a hypothetical situation. we are talking on radios, not racing 200 mph down the highway. people always talk about how we have no concern for those we are hurting by using big radios or out banding. i challenge anybody to tell me who we hurt, other than the occasional neighbor that has tvi and dont list the supposed owners of the 11 meter freqs because they were abandoned years ago by those services.

Out of curiosity, how would one convert one of these for 11M operation, anyway. I've heard it's as simple as pulling a resistor and resetting the CPU, and I've also heard it's MUCH more involved than that...

So what's the real story.?

Thats where you are wrong, your actions by posting in this newsgroup
about running high power and running out of band does hurt someone.
And that is your own hobby. A new CB'er comes in here looking for
advice on the best place to mount his antenna reads about you guys
basically thumbing your noses at the FCC. Its not so much that you do
run illegally but you so aragont that you have to flaunt your illegal
activities. I guess the "Hells Angels" had the same attitude as you
do? They weren't hurting anyone, but that image of the hoodlum
motorcycle rider still prevails today. Because of there I'm not
hurting one do anything I want to as long as it doesn't hurt anyone
attitude, almost anyone that rides a Harley is viewed
with distaste. Pretty much the way that legal CB'ers view you.

This is really a sad statement on your part. I guess it does point
to your attitude if it not hurting anyone why care about it? So let
all the kids smoke pot and use drugs, I don't care because it doesn't
hurt me? You should be ashamed to even call yourself a father.

cliff, forget about the tower. the best thing you could possibly do is to go get yourself a 40 foot push up pole at rad shack. install it just outside the window in your radio room. install the antenna on top of the pole. get you some help and jack that baby up into position and tie it off with some guy ropes. then go to the hardware store and get you one of those chinese pipe wrenches and attach it to the pole in a semi fixed position in such a manner so that as you are working dx with your radio , if you want to bring somebody in, then you just reach out the window and start turning that pole with that pipe wrench until the station that you want comes in strong. i hope this helps, cd is out.....

Granted, JR, there are operators which can be categorized unto that group of offenders for which you hold great disdain. There are also myriads from all walks of life that would fit that bill. I can empathize your point, but also disagree with it. Unfortunately, many ops do not take radio as serious as others, and view it as nothing more than a way to vent their inadequacies and shortcomings over the air. The type of person who ingratiates their self with other's misery. I do not equate those who raise hell on the air as necessarily prone to violence. At best, I would hold the opposite is true. Most who threaten and squeak the loudest are your so called "CB Rambos" who hide behind the mic and develop the persona they wish were true. No personal affront intended JR, I just believe that these ops would be the last to benefit from a personal confrontation and deep down, they realize such.
Thanks. Thought I was the only one who noticed.

so what your saying is we hurt new potential cb'ers? this news group doesnt even reflect 1/10 of 1% of the real cb world so get real. you say were hurting our own hobby. it would seem like that is what you want. wouldnt you like to see us go away? then there would be no out banding or big amps if CB was gone. oops i forgot, hams out band and run big amps all the time! as far as the hells angels go, arent they the same bike riding organization that does all that stuff for charity? hell half of those guys are bussiness men. you watched too much TV, only a small majority of those guys are the ruff and tough drug dealers like you talk about. here in the real world we judge people as individuals and not as stereotypes and that goes for hams, cb'ers, and harley riders. and as far as talking about "legal cb'ers" there are very few of those that have never broke a law. almost everybody either runs or ran a power mic too high, removed a limiter (illegal) or has jammed another transmission or something similar along those lines. nobody is perfect. like jesus said "let he who is without sin cast the first stone". and once again i stand by my challenge to show me anybody or anything that we hurt by outbanding or running amps the previous answer didnt even come close to that.

>

May be difference in watt meters.
I get 17-19 on SSB but not AM
By-the-way this 148 I have is a 4 pin mic model made in Taiwan.

Tony

Give it up Smokey, you can't reason with this type of mentality. He is of the "me" generation, everything is "me and what I want, me is all that counts, I should be able to do anything I want to and nobody can stop me, I should not have to consider others, me, me, me". This is the selfish, self-centered generation.

Hello All!

I have been reading with interest the comments in the above thread, particularly the challenge about whom may be hurt by freebanding and amps. The fact is that there IS harm done, and those frequencies above and below the regular 40 ARE used. You don't necessarily hear these users because their transmissions are of a business nature and are short and to the point. Sometimes digital modes are used. But when there are people ratchet-jawing on their frequencies, they hear it, and there are complaints--to FCC, Congress, etc. The amps, freebanding, et al, are a couple of the reasons attempts have been/are being made to get local enforcement and more involvement from FCC.

I am going to answer the challenge about "who are we hurting" with a true, actual event that occurred some years back. As a communications officer with the Civil Air Patrol, the USAF Auxiliary, I was participating in an actual search and rescue mission for an aircraft that departed Gastonia, NC for Eastman, GA and never arrived. We are assigned a number of frequencies from 2.3 MHZ all the way up to VHF. The choice of frequencies to use in a given situation is determined by a number of factors including availability of resources, MUF, $ security. On this particular mission, we chose 26.XXX MHZ because it was to be low-power, local air/air, ground/air, ground/mobile operations, AND to prevent newshounds and family members from listening on scanners. After all, it would not be good for a family member to hear a negative outcome (death) over a scanner. We quickly found that we couldn't use the frequency assigned to us because there was a "freebander" DXing there. His amp simply covered us up. I have to admit that I was seething with rage. To shorten the story, the freebander was found and received a heavy fine for his "hobby" AND for interfering with emergency rescue operations on a military frequency. So, freebanding DOES hurt--which is why it is illegal. I have to ask: What is more important? The CBer's hobby or the life of the pilot we were trying to save?.

I am not here to cause flames or insult anyone. It is just a matter of, as one respondent posted, right and wrong. Certain radio operations are illegal for a reason, not just to restrict or hinder one's hobby. The rules are there to provide for the orderly use of the spectrum by everyone. Some don't agree, but I'm not going to get into a shouting match or flame war over it. It's just the facts as they are, and I posted in order to explain why freebanding, brain-frying amps, and/or modded rigs are illegal. After all, if it were you being preventing from using the radio, wouldn't YOU be angry>

Respect to all,

Jerry

Very well said Jerry.... Though I may not agree with you, I could
not even begin a flame war with you. Because you took the time to
explain your position, and stated it very eloquently, I could not begin
to get angry with you. I do disagree with you though, I will not go
into who knows what or more, but there are more than enough
frequencies to use and the bands between 27.405 to 28.000 are
not the choice of most civil air patrols. But enough said, you
made a very good statement, and unlike certain other people out
here, I will say to you, take care........

The Landshark

Yes those frequencies ARE used and your true-to-life example was a good one and
I hope in 'sunk in' to certain people. People who have no respect for the law
also have no respect for others or for themselves. It is a sad and pitiful
case. Thank you for this great example . Glad to hear the freebander got what
he deserved.

Source record: 30821

Hi. I'm a Ham/CBer, more interested in the fun of cb these days.
Nothing against 10-10 numbers, contests, and nets of course. :)
I'd like to get something for 11m, including some freqs above 27.405, and some below.
Is 26.285 still a hot DX SSB frequency?
full 10m coverage would be nice too, but isn't necessary. I can get that from regular ham gear.

I'd like to have AM and SSB, although FM would be nice too. the first two modes are ok if the right radio happens not to have FM available.

I used to have a 2510 years backbut didn't like the following things:
tuning receive frequency with the "clarifier" didn't move the transmit frequency.
Receiver didn't perform as well as I'd like it too.
The thing drifted as it heated up and continued to drift more slowly, causing me to constantly have to offset by slight amounts.
The way the 2510 hooked up to external speakers, CW keyers, etc. was annoying. something with proper jacks would be nice.

Other then that, I liked the radio, and got great audio with a Roadnoise handheld echo mike.

Can someone suggest something that is a more solid performer, both in receive and transmit?
Maybe a Pres. Lincoln with extra freqs added if that's possible...

As for audio, I liked the Roadnoise mic because it gave me a good full sound, without the sharp pierce of a D104. I'd like clear highs, but not overbearing highs. Any suggestions?

Antenna back then was an Antron 99, no radial kit. Broad-banded, but caused major RFI/TVI problems.
I can't put up a beam, so what verticle should I get that will perform as well if not better than the Antron, but not cause all the RFI/TVI problems?

So, what's the best radio for my purposes?

Also, I know that 10m amps are illegal, but my problem is I couldn't find a CB "linear" that sounded anywhere near clean enough for ham use.
Are there any that don't sound noisy, give one a pinched-nose sound, or splatter over adjacent frequencies? Is clean CB linear an oxymoron?
What about the Texas Star stuff?

I knew someone who had an excellent broad-banded HF amp for ham use, a transistor amp called a Magnus Metron. Anybody know if these things are still around? It was solidly built, clean, and apparently had a *hushed

voice* 11m switch inside. oooo.

Well, that's it for my long rambling post. can someone suggest a really great station, given the above parameters?

thanks,

chris Smart, VE3 SHT. (yes, real callsign :))

Really dont know how....The radio works on 10 mtrs...amp works on ten meters...ant. can be turned to ten meters...I work on ten meters...(I am a ham oper ;)) for real!!! Tech Plus. Then of course I may have other ideas for this rig as well 0 ;)

As far as radio's go.....each has it's own good/bad side's, I would say whatever you decide upon"the older the better" get an old vintage peice of tube gear (valves) such as a Tram D-201/Tram D-201-A, nothing can beat them for audio or sonic quality. And as far as an amp....The "ONLY" and I mean "ONLY" c.b. amp I would consider is an amp made by "PRIDE" a pride 1Kw is probably the best amp ever made for c.b. use.....take it for what its worth, but ive had alot of years of fooling around with this and thats....and nothing beats the above combination.....NOTHING !!!!!!! Frank in CT.

> i challenge anybody to tell me
>who we hurt, other than the occasional neighbor that has tvi

The TVI is not as "occasional" as you think.

Meanwhile......

In a meeting with an FCC enforcement official several days ago, amateurs commented on cases of splatter from high-powered CB stations which interfere with 10 meter operation.

If folks would keep it clean, nobody would think twice about 11 Meters. Unfortunately, there are a few who will bring down heat on the rest.

~~~~~ See RadioDocs Radio Den at:~~~~~~~~~
http://members.aol.com/radiodoc37/index.html

Yaesu FTDx560 HF Tube Transceiver 10-80 meters,
plastic still on faceplate, excellent condition-
with copy of manual $250.00 SOLD

Alinco DR110, 2 meter mobile, 45 Watts Good Condition $110.00 Pending sale

Siltronics Mdl 90 -6 VFO $70.00

Siltronics Mdl 90 -3 VFO $70.00

Turner Plus Three amplified Desk Mic, Grey Model $35.00 SOLD

Palomar Skipper 300, Chrome Dome amplifier, 10 meter base tube amplifier. Uses
4 8950 Tubes, Tubes and amplifer in very good condition will swing 400+ watts
pep. $230.00

Kenwood TS520 HF Transceiver, Good condition, witn non-amplified D104 Desk Mic.
Also includes a kit to make your TS520 operate on AM. Kit include AM filter
and instructions. $325.00

Kenwood PB-18 HT Battery 7.2V 1100mAh, Like New in box hardly used $35.00

Kenwood PB-17 HT Battery, 12V 700mAh, Like New in Box hardly used $45.00

Kenwood PB-13 HT Battery, 7.2V 700 mAh, Untested $10.00 SOLD

Kenwood PB-32 HT Battery, 6V 600mAh, Untested $10.00

Cobra CAM88 Tube CB Base, 23 Channel Working, No Mic but I have the Mic Plug
with it and copy of the SAMs. $65.00

Realistic Navaho TRC-30 Base, 23 channel, Works good $30.00

RT-524 30-76 Mhz Military FM transceiver, Good condition an 8 on a 1-10 scale,
No nomenclature tag (desirable for collectors) Replaced with Serial Tag.
Manuals and original mic. $500.00 See Fair Radio Catalog for more info. Their
Price $625.00-$675.00

Swan 1200W 10-80 Meter Amplifier, Very Clean Condition, Uses 4 6LQ6 Tubes
With Manual. $250.00 Obo Pic will be on the WebSite Soon! Will trade for a
Kenwood TS520. SOLD

Yaesu XF-32A SSB filter for FT101 series, $40.00
~~~~~

Tram D201 Parts, Wood End Caps, Meters, Crystal/selecter Board, Transformers, Face Plate, Knobs, crystal filter, Etc... Inquire with your needs,.

Misc. 24V Switching power Supplies, Cosel, Power One Etc... Most new in the box

Crown IC-150 Stereo preamplifier, Metal cabinet
model with copy of manual $150.00 Obo Reduced $110.00

Midland 79-290, removeable face 10/11 meter AM/SSB/WX
Mobile,dual final design, 5 bands, WX, good condition with
stock mic. $110.00 Reduced! SOLD

Homebrew 3 tube 10 meter amplifier, uses 3 military
versions of the 6146, Seperate open chassis PA and
power supply deck. RF sensing, Plate Load, meter, SSB
and AM. 150-200 watts with low drive $130.00 Reduced to $100.00

Misc. Vacuum tubes (No Sweeps right now) See WebSite

Kenwood TS430, with AM filter and FM board, Manuals, Clean and working Great $400.00 SOLD

Browning Mark III receiver, excellent condition $140.00

Browning Mark III Transmitters, Make one good one from the two units $110.00

The above Brownings can be seen on the website

Icom IC-230 with manual, mic and mobile bracket. not working correctly, VCO unlocks but in great cosmetic condition,, $30.00 Shipped SOLD

Browning Mark III Receiver, Browning Mark III AM Transmitter, Very Clean! and D104 Mic $250.00 Pic will be on the Website Soon ! SOLD!

Tram D201s, Both have unlocked VFO's, One has lower freqs
with good AM and weak SSB the other has upper freqs with good
AM and SSB. Both in good condition $250.00 Each

Penetrator HB-150 10/15/20/40 meter Mobile amplifier, 150 watts class AB1
Low drive input required, super clean! $150.00

Yamaha FG-460S-12S, 12 String Guitar, Beautiful guitar, near flawless, Gold hardware, Pearl inlay, Seymore Duncan Acoustic Pick-up, Hard Case $350.00

Hooker 10 meter Amplifier, 1 pill design, PEP and RMS mode, CW/AM/SSB,
Preamplifer, Clean, still has factory seals $75.00

Pacifc Scientific / Superior Electric 2 Axis Servo System $250.00

Tram Diamond 60 AM/SSB Mobile, SIltronics Model 90 VFO -3 and Paradynamics Meter, All in good working condition $175.00 SOLD

VHF Trielectric Amplifier 13.8 VDC As Is $40.00

Motorola UHF 13.8 VDC 450-470 Mhz Solid State Amplifier, clean!, Surplus, As Is $40.00

Alan K1313 10 meter Single Tube Modulator, 110 VAC, With Spare 6KG6 tube, New Russian tube installed, Spare is 90% or better, Clean and works Great! $150.00

Johnson Messenger 250 Base, With Original Box and Manual $75.00

Astatic 10DA Mic Head, Works and looks good, Missing the locking Ring but plugs right into a D104 Stand $30.00

Fentone 500C Studio dual crystal Mic Head On a TUG8 D104 Stand, Wired to a Demco Tube Modulator. Smooth Clear Audio! $200.00 Obo

Pentax K1000 35mm Camera, Wide and normal lens, 2x teleconverter. Cokin filter holder with flare guard. Several special effect Cokin Filters, polorizers and acessories, carrying case etc... $250.00 Obo

SBE Trinidad , 23 channel base CB, near perfect condition, original manual $70.00

Fluke 8050A Digital Desktop Multimeter, AC/Batt, needs new batt. but works great on AC $50.00

NF Circuit Design Block Model CR-116 Low Distortion Signal Generator, $125.00 Obo

Misc, Yaesu FT101 Components and parts, Misc untested boards, Email If you need something.

Electrovoice Mic.... See Website!

You must be trying to make your cool looking CB actually work.
Since you obviously won't mount a decent antenna in a permanent
location, try a Wilson 1000 magnet mount. It's the next best
thing to a real antenna. <:

Don't keep in the freezer!

A diode or capacitor is changing value when it changes in temperature.
A can of freeze spray is your friend in this situation.

:
: You're right in assuming the 43 reads modulated signals
: inaccurately. My original statement was designed to
: convey the fact (to people in the know) that the 43 is
: inaccurate regardless of the shape of the waveform.

That is a bit misleading. A 43 will read the same power as a
thermal wattmeter in two cases (which are really the same thing),
an unmodulated carrier and a single tone SSB signal.

Yes, I misremembered. The APM-16 will read the same power as a thermal
wattmeter for all waveforms.

The information is at the Bird web site. The tech article is "Selecting
a Wattmeter for Digital RF Power Measurement". The site url is
www.bird-electronic.com.

I side with AES on this one. As a business person, I depend upon a steady stream of orders pouring in to pay my operating costs. Customer Service is a necessary overhead item. We reserve it for actual customers. We are not the public library, existing to furnish information as a public service.

Meanwhile, if you are getting this radio at such a bargin, who the heck cares how much the shipping cost will be? Is there a point at which you will NOT accept the radio? I don't think so!

In addition, someone at Mark's Aunt's end is going to take the radio to a shipping facility. Ask them to put a measuring tape on the radio, if this is so important to you. And one hint (since you apparently do not get involved in the shipping process very often), ask them to WEIGH the radio. You seem to be ignoring weight as a factor.

The bottom line: You went to an inappropriate source for information, when other sources were avalable and in a situation where it probably didn't matter, anyway.

As a long-time AES customer, I am pleased that "Al" took this position. When I call to place or trace an order, I like knowning that those answering the phone will not be tied up researching insignificant information for non-buyers.

Rest easy.....I'm confident that Al won't be fired. In fact, it's probably the opposite. If he worked for me and had complied with your request, I'd be having a serious talk with him about how he spends his time at work.

Can you give me an approximate amount of deviation a
crystal might show after, say 10 years? I seriously
doubt if it's enough of a frequency change to be noticeable
by 'ear'. Age is more a factor in the deterioration of other
component parts in an oscillator circuit. There are a
number of things you can do to change the resonant frequency
of a crystal, but normal use isn't one of them.
'Doc
PS - You ARE right about 'zero-beating' with the receiver,
I should'a remembered that.

I have a Mark III AM transmitter in a MK III outfit that I just got, and at first I thought that one of the Xtals (local channel) was bad, but after some air checks have determined the others to be equally off frequency. What are the chances that the aging will affect all the xtals equally, and that a mixer or oscillator touch up on the transmitter will bring them back within tolerance for AM use?

The aging probably has effected them. If I remember the Mak III did not have any adjustment that might effect freq. I believe there is a variable coil on the osc you could tweak this a little and see wha thappens. I think this just effects amplitude of the signal mor e than anything else.

It is different for different crystals and different circuits. We have radios at work that I can count on them changing about 200hz a year. The trimmer will let me pul lit about 1khz so the crystals get changed about every 4 or 5 years.

1452. K40 - Replace the PL259

Newsgroup: rec.radio.cb
Date: 2000-04-13 00:00:00 UTC
From: Posigian <posigian@my-deja.com>
Message-ID: <8d4otb$j4k$1@nnrp1.deja.com>
Source record: 30902

I have a K40 mag mount that has the PL259 connector coming off! Can I cut it off and replace it with a new one without it affecting the SWR or proformance?

My concern is using the soldering iron! Will the heat used to put the new connector on have any ill effects on the antenna? I know there is a small capacitor/resistor? (cant remember which) inside the coil and I have heard that if your not carfull it can cause damage!

So can I replace it without problems or do I need to order a new anttena?

Please eamil as I dont get back to this group too often!

Well, your little cellphone transmits at less than one watt to a tower
five miles away. A CB radio is four watts. Now you tell me, how far
will the signal go.

In actuality you should concern yourself with the receive-end of the
equation. Use a good quality antenna and a pre-amp.

If you are going to quote Websters at least quote it correctly:

Main Entry: 1crimï¿½iï¿½nal
Pronunciation: 'kri-m&-n&l, 'krim-n&l
Function: adjective
Etymology: Middle English, from Middle French or Late Latin; Middle
French criminel, from Late Latin criminalis, from Latin
crimin- crimen crime
Date: 15th century
1 : relating to, involving, or being a crime <criminal neglect>
2 : relating to crime or to the prosecution of suspects in a crime
<criminal statistics> <brought criminal action>
3 : guilty of crime; also : of or befitting a criminal <a criminal
mind>
4 : DISGRACEFUL
- crimï¿½iï¿½nalï¿½ly adverb

#4 describes freebanders perfectly, and the first 3 also apply to
them. Thanks for bringing Websters up, according to Websters
freebanders are criminals

On Wed, 12 Apr 2000 23:16:29 -0400 (EDT), twistedhed@webtv.net wrote:

wow, who was in charge of picking that freq? they surely werent very informed and made a horrible choice. jerry, even you can admitt that this was a freak chance and a bad choice all rolled in to one. i will admitt that it is a unfortunate event that happened but with all of the freqs available i'm sure it wasnt a major problem and it isnt likely that this happens very often. as far as i know the CAP are the only ones that would even come close to wanting to use this range of freqs and if they did it still wouldnt be a good choice. i'll also admitt we have one case of a freebander messing something up other than a nieghbors tv, one out of a million isnt so bad. isnt it interesting the only person that could come up with an example is NOT one of the people that are always ranting and raving that were causing harm

> five miles away. A CB radio is four watts. Now you tell me, how far
> will the signal go.

Not a good comparrison Mike. Your cellphone uses a 1/4 (at least) antenna. For moble (car) phones with an external antenna you are looking at full-wave and better antennas. The receiver on the tower is hundreds of wavelengths high (very significant for receive distance) as well has having extremely good gain antennas on the order of 10db or better. The ambient noise (background) on the 860-890 MHz band is almost non-existant. In towns and cities your cell tower may only be a mile or so away but out in the country that cell may be 5, 10 or even 35 miles away. There are some areas in west Texas where the cell-spacing is 35 miles on towers 200 feet tall.
Cellphones use FM which has a much better S/N ratio and either AM or SSB. Digital phones use various error detection and correction codecs that are also unavailable for CB.
These are conditions and equipment that you will find on noCB installations.
>

> Fairbanks, AK

Actually Mike, even the best pre-amp on the market is unlikely to increase your receive range on CB. All it will do is increase all the noise. So instead of having a noise level of S5 your noise level will be S9. If the signal you want to hear is below that noise level all the pre-amplification in the world will do you no good. Pre-amps only work if the background noise is low in the first place.

But to answer the original question. With any "shorty" whip and a legal-power transmitter the best range you can expect is only a couple of miles (depending on the ambient noise.) With a 1/4 wave (102") antenna you might get 4 or 5 on calm days but no better.

Kevin, WB5RUE

as far as receievers go on these type radios you already had the best. no cb/10meter radio i have used has been able to beat it, especially when it comes to the noise blanker killing qrn. 26.285 is still great in the mornings for europe but quite after about 3:30 in the afternoon. i would suggest you go with the lincoln and have a chipswitch added http://www.chipswitch.com they will had a lot of extra features. i run 100watts into a antron with no radials and dont have much tvi. any antenna will cause it, the only thing you can do is ground your station and make sure everything is clean. for ssb amps on 11 meters texas start doesnt have a comparison as far as current models go but its best to beef up the power wires.

>
>Hi. I'm a Ham/CBer, more interested in the fun of cb these days.

I did quote it, EXACTLY from the 1998 Webster New Compact Format Dictionary. See, the reasoning behind the compact version is I don't need the pronunciation, origin, syllabic hyphens, or examples of words used in sentencing. I am aware of definitions and usually comprehend with out protracted examples. Since you seem to be so preoccupied with classifying freebanders as criminals, make sure to include thy righteous self. As I told the other poster, if an infraction of any law or ordinance, no matter how trivial it is perceived, is grounds for the moniker such as criminal, then we are all guilty to some extent.

Tim and Crew:
Frequency allocations can be found at the NTIA website which covers DC to Light so to speak. The problem with freebanding is that you never know who or when the legitimate user might need the frequency or what mode of transmission they might be using. As a CB/Business band/maritime/FRS/Amateur user of the various parts of the Radio Spectrum, an unauthorized user might block communications either vital to my business or personal well being.

Legitimate users tend to get testy since the have the right of Law to use the frequency and who can fault them for wanting to use the frequency/channel. The Freebander gets upset by this but then a person who has no legal right to be on a frequency doesn't have a legal leg to stand on (sorta to speak). A thief doesn't like to get caught either but when the rule gets enforcement, don't cry, you take responsibility for your own actions.

If you believe that "responsibility" means it is noble or manly to break a law so long as you accept punishment "without crying" when you are caught -- then your concept of "responsibility" is in grevious, grevious error.

Also, I have no doubt that, if faced with a $17,000 NAL as a result of your unlicensed activities, you'd quickly engage a personal attorney to do some amount of "crying" on your behalf.

Early versions of the radio have a resistor that needs to be removed, then pull channel selector knob, clip the very obvious diode hiding in plain sight and reset cpu....

current versions just need the diode clipped that resides behind the channels selector, some need to be reset others do not....

The radio is a real screamer!! I like both of mine, they do have a NOISY rx, but it can be lived with....

I was the writer of that string and I will explain it. Each person is
responsible for his own actions, no one else. If someone is caught
then it is his or her resposibility, do not cry "Everyone else is doing
it, so it is ok." The $17,000 NAL is a punishment that some find
unfair, I am not argueing the fairness, only that if a person is
caught, they bear their own responsibility and not wimp out. It is
"manly" or "noble" to obey laws, but you must accept any responsibility
for breaking any rule or infraction. Please read the whole post.
Thank you,

Martin

Chris,

<big snip>

FYI The Metron amp is not made anymore. It was last available around the early 90's AFAIK. The company in Escondido, CA Trans World Electronics are now called Daytron or something similar, and make military equipment.

I have two MA1000 Metron's new in boxes. They are a true broad-band amp with switched filters and 8-pills a piece.

Similar ham/mars band units are still made by the following: Henry, Ten Tec, SGC, MFJ and others. Just do a search.

If you want a unit just for 10/11 then others here will tell you what's good and what's not.

Good luck.

Phil / UK

>The fact is that there IS harm done, and those frequencies

>because their transmissions are of a business nature and are short and
>>to the point.

The truth of the matter is a business may be permitted to emit a single on a assigned frequency. No communication is takeing place. No one(buisness) can hear a free bander.
For example: an Eddy Currant is a devise used to detect stress cracks in metal or other materials. It by doing so it emits "noise" "tones" on a given frequency.
Freebanding does not, can not, interfere with this device or othet buisness uses.

>I was partici-
>>pating in an actual search and rescue mission for an aircraft

>We are assign-
>>ed a number of frequencies from 2.3 MHZ all the way up to VHF. The

>On this particular mission, we chose 26.XXX MHZ because it was to be

No Military Op would choose this frequency range for a mission of this importance. You can't expect us to beleave this lame story.

Nice try though.

Oh, you mean to tell me that I couldn't hear a guy hollering "Breaker, Breaker thar, this h'yar is the OOOOOOOONNNNNE SaddleTramp in North Carolina callin' skipland, skipland, skipland an' standin' by"? Friend, the incident is true, you can choose to believe anything you like, but you nor I are the Arbitor of Truth. As was said in one post, you can review NTIA's (National Telecommunications & Information Agency) lists of non-secret frequencies, OR just go to your local Radio Shack and get their annual book of frequencies and you will be surprised at how many of those "freeband" frequencies ARE assigned to gov't and military. The statement you made about "no military OP would choose to use" that range of frequencies shows how little you DO know about MUF (maximum usable frequency, frequency management, security, interference, proper utilization or other factors that are part of professional or military communications. No freeband station can interfere with a business? HA!

Guys, I even stated the reasons why I (yes, ME) chose 26 MHZ for that particular assignnment. Still, so many are locked in denial....(Sigh!) Again, I didn't post this to cause flames, just to present information. The incident is true, the arguments against freebanding are valid, and I originally responded to the challenge to provide any incident where freebanders caused harm. This I did. What more is needed than to show where someone thought his hobby was more impportant than someone else's life?" It wouldn't have to be 26 MHZ--it would be the same thing if it was on 27.185, 4 MHZ, or 18 MHZ. The guy was where he had no right to be, he interfered with emergency communications, was caught, fined, and narrowly escaped jail. Good, bad, or ugly, that's the way it happened.

Best 73 and respect to all,

Jerry

I respectfully disagree. The difference is in the potential number of people who might be affected by your action. Changing the chip on the engine ignition might change the emission content and might bump it out of compliance, but it would take electronic equipment at the tail pipe to notice it, and it still might be cleaner than a 10 year old car with stock emissions. When you crank up the amp, you have the potential for wiping out a chunk of spectrum that others might otherwise use. Often, you are unaware that they are around because they might be hundreds of miles away. But if you can't touch them, they don't exist, right??

Source record: 30948

I borrowed a friends pickup to do some moving. He runs a kenwood
that has been opened for general transmit. While having a QSO
with another state I suddenly received an RF burn on the palm of
my hand from the metal plate on the back of the mike. What the
hell caused that! (I thought a wasp had stung me.)

In addition I noticed I had a bad headache right after that.

Did I fry any brain cells? (I can't afford to lose any as I
barely survived the 60s).

He does run the radio a little hot....could that have caused it?

Less ATMOSPHERIC noise (static) no there is not unless you get significantly higher, say 20MHz higher. Noise from other stations, yes. Most of the noise that you hear other than the background hiss and occasional static crash from lightning is from the other 5 million or so CB stations on the air.

Yea Jer, these freqs are assigned to specific govt. orgs. and companies and the like, I agree with you there. However, I believe the rationalization at hand here is that those frequencies are not utilized by the entities you describe on a regular basis. Your story may be 100% accurate, but it is not the norm. If we researched deep enough we could probably find an example of where a freebander responded in ASSISTING in a crisis(But that would be ok because "it says so".). The point I am attempting to get across here is that if it presented a clear and immediate danger, enforcement would be swift and harsh instead of the repeated warning upon warning to rectify the situation. Jam a commercial aviation station and see if Unca' Riley isn't upon you like white on rice. Now jam 27.555 like some lobotomized individuals have taken it upon themselves to do for the past few months. No safety or interference complaints = no enforcement. In this day and age, many more reliable modes of communication are available for emergency purposes.

Agreed because my HR2510 can scan the 26MHz band (think it can even talk
on it, too). Besides, isnt the 26MHz band for HAM operators?

Right..............he was burned by 12 volts. NOT

The case on the mic should be grounded to the chassis. Check it out. The radio chassis should be grounded to the automobile. Do not depend on the negative lead or the coax shield to establish a good RF ground.

Try to stay away from nine foot lengths of coax. It is better from the standpoint of creating a voltage minimum at the radio to use an 18 foot length.

Turn the radio down.

Redwire,
Ground the radio. RF burns mean high level RF in
the mic ground/radio ground. Bet either thr radio, OR
the antenna is not grounded.

LAW HAS 3 SOURCES:
1. Natural Law (sometimes called God's Laws which in the
Judeo-Christian belisf system are contained in sacred texts)
2. Artificial Law or man-made (written legal system stuff such as
Speed limits, amp and frequency usuage, etc)
3. Societal Norms-What will society toerate as a group? basic belief
system but usually a mixture of natural and artificial law.
Martin

Its not a replacement but rather an addition to the other Citizens Bands. The radios are more efficient for their low power outputs than 11 meter handhelds and provide high quality FM sound. There is also a Citizens Band at 31ghz as well.

Source record: 30969

Hello Gary,
Well I disagree, respectfully too.......... While if I was running an
older amp & radio, everything clipped and splattering the world,
it's the same excuse right? But if I was running a clean amp, clean
radio I doubt it would be affecting people hundreds of miles
away. I have sat at altitude with power before, and to tell you
the truth, the best I've every done was from the Bay area to
LA (Where someone else was on a hill) without skip conditions.
Now as far as skip.............. Well we won't go there, but I'm sure
someone else will. So to conclude this statement I will say, if I'm emitting
more emissions, noise, consuming more fuel I am obviously hurting
everyone in the world. So holy Crusaders Unite, we are going on a
great crusade.............

The Landshark

I'll keep this sort. Recently alot has been said regarding Freebanding, Amps, For Sale - For Auction postings, and any thing else that doesn't conform to the beliefs of a few. A FEW obviously with a lot of time.
Any way. Just for fun. I thought I would take a poll. How do you judge, determine, what is right or wrong?
Example: The rule of law "man's law", God's Law, parental upbringing, society and it's trends, or what ever makes you feel good.
I look forward to seeing all comments.
Please feel free the participate.

Nope. Check the allocation list. Above and below CB belong to various
government and military groups. Y'all might not like the story, but it
is quite believable. Yes, yes, it doesn't get used very often, but it
DOES get used.

Source record: 30982

<< I borrowed a friends pickup to do some moving. He runs a kenwood that has
been opened for general transmit. While having a QSO
with another state I suddenly received an RF burn on the palm of
my hand from the metal plate on the back of the mike. What the
hell caused that! (I thought a wasp had stung me.) >>

EXCELLENT idea! All CB and EXPORT radios should be MODDED with this feature so
that when you DROPS YOUR MAUL and HOLLERS YOUR CALL the RF gets routed DIRECTLY
into a metal plate on the mike. RF corresponds to SSB or AM voice peaks. More
swing = more voltage = more RF burns. It works sort of like a dog obedience
collar.

Jason;

You'll get as many diff answers as there are radios, some guys love em, some hate em....
As far as working DX, some knowledge of the propagation characteristics for the band your using would be helpful. Location is also a big factor, but more important is making sure your radio is working properly and that you are resonant with your antenna. If terms like VSWR, overmodulation, deviation, etc. leave you with your jaw open you'll need to educate yourself. There are many good publications out, The ARRL antenna book, ARRL handbook, even radio trash has some basic reference materials available. Remember, power is not always the answer, I once worked a Mediterranean station on 5 watts!!!!

With a little education, some patience, you'll be well on your way to making many fine QSO's...
Right now we are at the peak of solar cycle 23, and the opportunity for long distance contacts abound, good luck and happy DX !!!!

True, but also remember that when ARRL proposed and later
got it's "Incentive Licencing" from the FCC, nearly 75%
of the USA based ham manufacturer's went out of business
in the following 2-Year period, and lost a full 40% of
their paying membership in the organization.

I know. I was *there* when it happened, and it does not
suprise me that the guy (callsign?) who was ARRL Pres.
at the time came up with this disaster from which the
hobby has >NEVER< recovered. (The ARRL President
at the time was also known as a red-nosed drunk,
along with some of the Board members. They nearly had
to CARRY him out of the 1966 or 67 Dayton hospitality
room... He was so LOADED with Seagrams and Old #7
that he couldn't walk more than 3 steps at a time
without falling on his face. All hail our fearless
leader! All hail Incentive Licencing! Pass me
another drink boy! -hic-hic-hic)

> HF in the early days.

Again true. But remember that AMSAT accounts for
0.8 percent of ham radio enthusiasts also. A drop
in the pond. This is a gem in the rough. If the AMSAT
boys could come up with a way to couple *wireless*
internet access with HamSats, THEN you would see some

interest in young people in ham radio.

Nahhh, it will not happen, too many folks want
stupid mores code and are bitchin and moaning
about April the 15th of 2000 or something.
Status-Quo, Same ole s--- different day.

> The ARRL has been talking bull out of both
> sides of its mouth and the whole thing has
> been a smoke screen money-grab, and it has
> suckered in alot of hams over the last year.

Not really, their membership stats are dropping
about 5% (or more) per year. The old standby
crowd is dying off. 15 per month to 1 new member
joining. This is what's called a revenue disaster.

All they're interested in is keeping their
ivory building well-covered in English Ivy
and those nice advertising revenue checks
rolling in the mail from the "Big-3"
Jap radio builders, and QST subscriptions.
Hope they have a big marble stone to plant
on Main Street in Newington in a Year or two...

> The League says it's moving ham radio
> forward, but I haven't seen any proposals. The League says
> gaining more hams by removing some exam elements will
> advance ham radio, they said the
> same thing about the no-code tech which didn't
> advance a thing.

Correct! And add to that as long as code is required for ANY
class of radio licence, you will never attract new
people. Code is about as relavant today
as buggy whips, horseshoes and dial-type telephones.
Come to think of it, much of ham radio is just as outmoded
too.

> Make it harder to be a ham and those that
> make it will certainly have the initative to
> move the service forward and protect it.

Yes, I am sure all EIGHT of the new hams will!

Guess what, you just >re-instituted< Incentive Licencing!

HOW the phuck does this keep re-appearing? It boggles my
mind why Hams are so addamant to think that making something
harder will somehow *increase* both quality and quantity. I don't
know about you, but between work, kids in college, time wasted
in commuting, weekend chores, soccer games for the
youngest etc etc I am lucky if I talk an hour-a-day on 2M

and this mostly while waiting in traffic on the Interstate.

Tell me, HOW is someone going to make time for code and other arcane stuff to get an ham licence, when for FAR LESS MONEY, they can pick up a Pentium-III computer and be "Plug-and-Play" on the Internet with RealAudio and a gazillion webpages and chatrooms to select from?

Finally, about 2 Meters.. HA HA HA!!

You can get a *pair* of Family Radio Service UHF walkie-talkies from Motorola for about $120.00 No Licence. No learning code. No test. No problem. Put 3 "AA" batteries in, and your on the air with 13 channels and 32 PL tones to choose from. (MUCH cheaper than 2 Meter rigs)

FACE IT GUYS HAM RADIO IS IN IT'S DEATH THROES. THE ARRL KNOWS IT, AND SO DOES EVERYBODY ELSE. Hamfests are being canceled all over, people AIN'T comming anymore. Dealers AIN'T comming out anymore. It a non-stop ride down the technological whirlpool of history. Used to be that ham radio was UNIQUE. To talk to someone in Europe or make a phone call from your car used to be something new and interesting. Today, you can do all this on the Internet and via cell phones and FRS radios.

FACE IT boys, ham radio IS as OBSOLETE as a vaccum tube television set is in the Year 2000. Enjoy it for the next 10 years at the most, before it's relagated to the antique shelf display in a dusty corner at the Smithsonian.

And that, my friends, IS the real TRUTH.

> He does run the radio a little hot....could that have caused it?

Possibilities:

1. The antenna shield is not in fact grounded to the body of the truck. When you touched the body and the mike, you just became the ground path.

2. The truck is more than likely a GM product where a strap (or several) connects the body to the engine to complete DC ground connections. The truck may have been repaired by a lazy body man. On some GM products (Camaros for one) this often results in the lites getting brighter when the clutch is stomped on. If the truck is an antiquity, the straps may have been corroded. If your friend is an incompetent customizer, somewhere along the line he said "these wire thingees aren't cool".

3. For some other reason, DC ground and RF ground are not the same thing so with the mike in your hand and some other body part on the truck body, you personally became the best RF ground path available. The good news is that it will work all kinds better (both the truck and the radio) when you get it fixed.

Many years ago my dad got an RF burn while fortunately saving himself from electrocution by hitting himself in the forehead with the mike. It wasn't funny at the time but having ASTATIC burned in mirror-image across his forehead for a week or two reminded him about safety every time he shaved.

How slow are they...you want more? They are so slow that Brian Griffey will have respect on this NG before your amp arrives. How slow??? I ordered a Texas Star amp when they went out of business. Texas Star came back and my amp from them arrived before NoNames. How slow? If you order an amp today the address they send it too, will no longer be valid.

These guys couldn't even get the basics right. Like keeping RF out of the Fan, still using "bread-board" construction techniques and couldn't even wire a simple remote phone jack on the back of their amp correctly. The edges are so sharp on their boxes you'd better make sure your Tetnus shot is current. If they can't get the small things right, how will they get the design right?

New Boxes...new design, but same old "glad garbage bag!!!"

You could be picking up noise from the auto electrical
system. I've had 12vdc cigarette lighter plugs - actually the
wire - do this on my handheld CB radio. Mine still picks up the
alternator some, but it was considerably reduced simply by
twisting the wire. It helps to make sure everything is
thoroughly grounded - I put a couple of extra ground wires on
the engine and alternator. You can also shield the wire, and you
might try some of Radio Shacks auto type filters.

Bill,
Sounds like your picking up noise fron the computer, through the power lead, not very uncommon at all. The 'cure' is to 'by-pass' the power lead by placing a capacitor between the (+) and (-) power leads. Might also use a 'choke' in the (+) lead. The closer you can get these to the computer, the better. There are other 'tricks' that may work, just have to find the 'right' combination. Good luck.
'Doc
PS - 'course, you could always send the 'puter and GPS to me! That'd solve the noise problem.

Message-ID: <VA.000000c7.0376d674@xor.ccxx>
Source record: 31015

I've read through a bunch of old messages in this group about modding the 510. People seem to be split on the subject of cutting D14 or not. The prevailing opinion was that it helps a lot with a few saying that it causes too much splatter. FWIW, I only use my unit on the road.

My question: am I better off doing the mod or getting a power mic? Most of the comments said that you couldn't do both. Right now I'm leaning toward the mod.

What's the best way to tune the coils? Do you simply tweak them for max power through a dummy load or are there other gotchas involved?

Also, one of the mod sheets suggests replacing the 2.7ohm resistor in front of the final bias resistor with a .47 ohm resistor. None of the other PRO510 mod sheets suggest this. Anyone out there done this, know what it does and can verify whether it helps??

Finally, anyone know a good tech in San Diego??

Can someone explain to me the meaning of haveing an amp that has 2000w input and puts out 1000w SSB? I'm about to buy one that has 2400w input and output is over 1000+ on SSB. Isn't it 2000w out on SSB? Even the website says 2000w input and 1000w out on SSB.
Also it shows 800 mills of plate current at 3000volts. is this good for a used amp. Says he just put 2 new 3-500zg's in it. Any other input would be of great help.
Thank you
Steve

It is not legal for a ham operator to blast through neighbors tvs. If a ham coused TVI while running illegal power on any band that is a violation. If the ham is opperating a station legaly and couses TVI it is the responsability of the ham to do all he or she can do with in reason to correct the problem.

Source record: 31019

It is NOT alright for a Ham operator to have his transmission effect another broadcasting singal...no matter what anyone else says...the BIG diff. here is that the FFC ALLOWS them to have an amp in-line were-as CB'ers are limited to 4 or 5 watts...NOISE is NOISE all of the good hams and CB operators try to run a good clean station. Things like TVI and other stuff is going to happen, but what the operator should do is to check around to see if he/she is causing it, and if so attempt to correct it as soon as you can!!!! The worst problem I ever had was over 23 yrs ago when I lived in a duplex. My rig (yaesu 101E..driving a palomar 300a...driving a Phatom(sp) three stage 1500 watt amp with a Wilson shooting star in the air 85') was getting in the telephone lines of the person next door. That took forever for me to fix...finally after wrapping enough torid coils around her phone line did it help. Two of the biggest boo-boos when I was active was a poor ground and high swr's...I am sure that still applies today as well.....

Another question not related to this to the group..do they still use numbers like 34W (Kansas was the 34th State to enter the union) I forget the others.

Peace to all

Ron

<< Hi. I'm a Ham/CBer, more interested in the fun of cb these days. Nothing against 10-10 numbers, contests, and nets of course. :) I'd like to get something for 11m, including some freqs above 27.405, and some below. Is 26.285 still a hot DX SSB frequency?>>

You mean the "fun" of illegal operation. By the way, 26.285 is assigned to military use.

<<So, what's the best radio for my purposes?>>

My opinion is *none at all*, since you can't be trusted to keep your word. When issued your Canadian amateur license, you agreed to stay within your frequency allocations. Apparently you think it's all a big joke.

<<Also, I know that 10m amps are illegal, but my problem is I couldn't find a CB "linear" that sounded anywhere near clean enough for ham use.>>

I think you mean to say 11 meter amps. No matter. A Canadian ham who wants to run a linear on 11 meters doesn't have much sense anyway.

<<<Chris Smart, VE3 SHT. (yes, real callsign)>>>

Well somewhat true. If the ham is not running power over the legal limit, and all emissions (spurious emissions and harmonics) are within specifications, the the ham is not legally bound to do anything to solve the interference. It is up to the person being intefered with to solve the problem of their devices. However, if the ham wants to be a good radio citizen, he will certainly work with the other party to try and help resolve the problems.

Hams are allowed by FCC rules to run linears up to the max power limit as stated in part 97 of the FCC rules governing the amateur radio service. The amount of power one can run is determined by the class of license and in some cases the mode of transmission. Not all classes can run the max limit. It isn't a double standard, cb was never ment to be a high-power hobby band, if one wants to run high-power legally, that is what the ham license if for. Now if one is too lazy to study and meet the reqirements for a ham license, well, that's their problem.

No, in fact the rules are quite the contrary. The affected equipment is
required to accept any interference received. Since a legally proper ham
station might be able to be received, on, say, a toaster, it is unreasonable
to expect the ham to have to correct that. After all, if a toaster is
receiving radio signals, then there is something very wrong with its design.
Amateur stations that conform legally and technically to the law, are not
responsible for interference problems under US law. Most hams will be glad
to help, though.

volts times amps = power...so 3000 volts at .8 amps (800 mills) is 2400 watts INPUT power. But nothing is 100% efficient . If the amp ran 50% efficient you would get half of 2400w output ie 1200watts. Think you will find the Henry to run more like 70% efficient, but probably when Henry was building that amp the max ham output was allowed by law to be 1000watts, and so the ads read 1000watts.

Steve,
Here's how it works. Read the Plate current meter,
get the reading in ma.(milliamps). Read the Plate
voltage meter, get the reading in volts. These are
the 'input' readings. You should also know how much
power, from the radio, is used to 'drive' the amplifier.
Next, multiply the Plate current times the Plate voltage
which gives you 'input plate power' in watts. To this,
add the dirve power (output of the radio in watts). This
gives the total input power. To find out what the out-
out power is for CW, multiply the total output power
of the amplifier by 65% (average efficiency of grounded
grid amplifier). This is the 'average' output power.
To find the output in PEP, for SSB, multiply the total
output power by 65% (same as for CW), then by 1.414.
this -converts- average output power to PEP for SSB
power.
Pin = (Pa X Pv) + Input power
Pout(avg) = ((Pa X Pv) + Input power) X EF
Pout(PEP) = ((Pa X Pv) + Input power) X EF X 1.414

Thats how you figure power for an amplifier. Howzzat?

Bean,
Have to disagree with part of what you said, the part about the ham having to correct RFI/TVI problems. Having been there and done that, including going to court twice over this RFI/TVI thing, I've had to learn a whole lot about what is and is not required on the hams part.
As long as the ham is opperating a legal and 'clean' transmitter, and does make reasonable attempts to stop any spurious or harmonic transmissions, he doesn't have to do anything else. PERIOD! If the ham -wants- to offer advise to the people who have equipment that is improperly designed, so that it receives transmissions it is not intended to receive, he can certainly do so, BUT, he doesn't have to.
The 'zinger' about RFI/TVI is if the transmitter being received inadvertantly is used in a LICENSED service or not. Amateur radio is a licensed service. CB radio is not a licensed service. (sorry 'bout that!)

It is not legal for a ham to cause interference,if it's his fault he
is in the wrong.Just because a neighbor has interference when the ham
operates doesn't mean it's the hams fault.
The spectrum regulating authorities don't want just anyone using the
spectrum without a little knowledge of the possibilities of worldwide
propogation,harmful effects,interference,manners,etc. Amateurs must have
at least some knowledge of these to get ;icensed and therefore are
allowed more power,much more spectrum,more modes,etc The CB band was
meant as a place where any idiot with no knowledge of the above could
have a little spectrum without causing too many problems,unfortunatly
they used a freq the would support propogation between any 2 points on
the planet.
Most hams never run the legal limit and a large % run 100 watts or
less,of course we don't all use A99s.

Good question, why would the ARRL even concern themselves as a body politic organized for Amateur Radio with the question of distance on the CB Freqs. The excuses given by ARRL lok like busy body stuff. It is doubtful if FCC would open up CB to DX anyhow and the ARRL lost some goodwill.

I think you must rephrase this a little. A ham operator has the
right to run his legal power. He does not have the right to impede
on others quality of life. Meaning, yes he can do everything within
his power (no pun meant) to prevent it. But after all said and done,
if he still cause's TVI/RFI he must then work out a mutual agreement
on times for use of said equipment.
This happened to 2 hams in my area that were running pretty quality
equipment, but were causing TVI/RFI. The Hams did the best they
could do, but still caused TVI/RFI. The hams told their neighbors that
that was as far as they would go and they had to live with it. Well the
neighbors said "Oh Really" took them to small claims court, told them
that the hams, though legal were impairing their quality of life.
The court ruled in the neighbors favor, and told the Hams they
were going to have to workout schedule to everyone satisfaction.

True Jerry, but why does the ARRL concern itself with this matter
when CB is not part of the Amateur Service? Let a sleeping dog lie,
why kick the issue when the FCC was probably going to trash can
it since it would have brought forth many new concerns.

Wrong. Since when can you simply multiply a average power (cw)
by 1.414 to get a PEP?

The ratio 1.414 is only useful when converting an RMS voltage or
current to a peak voltage or current. It is totally useless when used
with power.

If you compare the CW signal to a two tone test signal and you keep
the average output powers the same then you can say that the 1000
watt CW signal is equal to 2000 watts PEP.

You are right, that is exactly the point. Being a ham myself for 30 years, that is my feelings. Why fight something I wish they had done 30 years ago. The good ole boys at the frat house(ARRL) did a fine job of keeping out many by using the code to weed out the underlings. Some of us think ham radio ranks right up there with world hunger or a cure for cancer. The better informed of us do know this is not true. I will continue to enjoy my hobby of radio and use morse code and phone and it will be better than before.

Mine does the same thing...though i have my AM carrier set at 4.25 watts, and my FM carrier set at 11 watts output. Considering that Eagle does not have the 11 meter band, which is band ' E ' labled as such, but left it blank while lettering the other 9 bands accordingly, leads me to believe it has something to do with the FCC. The factory setting on the Eagle was 4 watts AM, 5 watts FM.

Landshark:
The Petite Letter issued by the FCC in the late 1970's stated the
FCC's position under the Federal Regulations, that is, that the FCC

and only the FCC has Jurisdiction in matters of RFI and imposition of local rules were superceeded by the Federal Pre-emption clause of the Constitution. Amateur and CB are considered Federal Matters for the most part (CB is still licensed, by rule, that is, any person not restricted from owning or using a radio is licensed by virtue of using a radio approved by the FCC). A local court can not impose upon a licensee any requirements for the operation of that equipment. An Attorney will tell you Federal Law overrides local law anytime. A writ from a Federal Court (called Certerori, or "LETS TAKE IT HIGHTER" wil remove a case from a court attempting to exercise jurisdiction into a higher court inorder to determine the proper venue).

Local Courts want to take jurisdiction and will try. Part 15 rules under which most if not all household appliances and the like run dictate the acceptance of interference and that the household appliances must accept any interference and must not cause interference and further if they cause interference, they appliance must be shut off. Nobody likes to be told about Part 15 and those outside the Radio Hobby or Commercial Radio are not aware of Part 15 and its implications.

I don't understand why so many of you Ham operators continue to hang out in this NG. If you don't like what CB radio is about "GO AWAY" Go to your Ham NG and stop cluttering up this NG with BS that we don't care about. I guess all the CBers need to go to the Ham NGs and start threads pertaining to CB to get the point across.

Hello & Good evening,
That may well be, but in this instance it was small
claims court. They had recorded both audio and
video interference along with the times and dates,
apparently over the phone, TV, radio.
The judge ruled basically in favor of the neighbors,
you can say, because he told them and the ham
operators to work out a schedule for transmissions.
If I remember correct, he said something like
"Even though they are licensed to operate a radio,
they can not interfere in such a way that other peoples
life and simple pleasures are disrupted". Please
don't hold me to that quote, but it went along those
type of lines.

I have a relatively new Camaro and am currently using a no ground plane, throgh the glas antenna. I know it sucks.

I wanted to know if I had any other alternatives. I don't want to drill any holes.

I have tried my trunk lid Wilson 1000 just above thehatch window, but here's not enough to really grip and it can (and does) fall off easily.

I tried a magnet mount. The problem s that there's not enough metal near the rear hatch for the magnet to grip (AND I don't want it to scratch the finish).

Anyone have any ideas?

Thanks in advance.

If the ham had a good atorney, it would have been pointed out that the court had no jurisdiction and it would have been tossed. The FCC has from time to time set up a schedule for 'quiet hours' in unusual circumstances, but the basic rule is that the neighbor with the Part 15 device needs to read the fine print on the owners manual and understand that his $49 color TV manufacturered in China with no shielding and a loose front end is going to suffer from interference.

<< With the inception of greatly eased amateur radio test
> requirements there is no need to seek government sanction for a lawless
> monoband version of ham radio.
>
> Alfred Jarry

True Jerry, but why does the ARRL concern itself with this matter
when CB is not part of the Amateur Service? Let a sleeping dog lie,
why kick the issue when the FCC was probably going to trash can
it since it would have brought forth many new concerns.
Martin N5PZJ >>

Martin, you may notice that the League comments on many proposals that are not strictly concerning the amateur spectrum per se, such as cable and satellite frequency allocations and proposed commercial use of nearby spectrum that may cause result in interference to the the amateur service - or visa versa (in many cases). The proliferation of unlicensed radio operators in the 25MHz to 30MHz band and the related problem of "export" radio transcievers, and power amplifiers targeted to this segment is not a "sleeping dog" by any means. Note that the League's key comment was a concern that such legislation would "encourage the use of illegal power amplifiers". The spurious radiations of highly amplified spectrally impure signals originating from unlicensed operators now appear with great frequency within the amateur 10 meter band. I see the League's concern as genuine and an effort to protect amateur interests within the 10 meter band.

A. Jarry

The local court has no jurisdiction over the hams transmissions. A good
lawyer for the hams could have cleared that up right away.

And unlike on the ham bands where this type of activity may occur on
just a few frequencies, it occurs on just about every, if not every cb
channel.

The Connex 4400HP or the regular 4400 are great radios with features like L/M/H Power, 8 bands, R. Beep, Turbo Echo, on/off talk back that is variable up or down and standard radio features. They are the same basic chassie as the cobra 148 dx, connex 4800, rg radios and so on. Our new site will have much of this info when completed at, www.xportsrus.com

1633. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.cb
Date: 2000-04-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8d8qi6$5nm$1@news.hawaii.edu>
Source record: 31083
Cross-posted to: rec.radio.broadcasting,rec.radio.cb,rec.radio.info

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

The amp you bought is one of the best built "Z" boxes. Do not exceed 30w carrier input, or 500w pep input. With 200w pep in you should get 2kw out. At that output peak, set your input carrier at a level that gives you about a 500w carrier out.

: volts times amps = power...so 3000 volts at .8 amps (800 mills) is 2400 watts
: INPUT power. But nothing is 100% efficient . If the amp ran 50% efficient
: you would get half of 2400w output ie 1200watts. Think you will find the
: Henry to run more like 70% efficient, but probably when Henry was building that
: amp the max ham output was allowed by law to be 1000watts, and so the ads read
: 1000watts.

The only time the Henry would run 70% efficient is if it were running Class C.
In AB1, it is closer to 50%.

Yes, many Ham amps are capable of more than legal power. The Ham is trusted
to limit the drive to keep the output to legal levels - and is also supposed
to monitor that output power.

Wrong. If the Ham is operating a legal station, then he/she is under no obligation to try helping the neighbor fix the defective consumer electronics.

In practice, it is wise to try to work things out with the neighbor, such as suggesting fixes for the problem - or agreeing to not operate during certain hours of the week.

It is not a double standard. The Ham has a license that allows high power. The CB band was set up for low power - and is unlicensed.

Whether it should, or should not, be this way is a subject for another thread.

Funny. State/city courts do not have jurisdiction.

For one thing - how about the neighbor requiring me to work out a schedule affecting MY quality of life? That is one of the reasons that local courts are not allowed to preempt federal law.

This is correct, and is stated on the paperwork that comes with any receiving device sold today. It specifically states the owner of the device must accept any signal received by the device. With the constant scaling back on the quality of manufacturing practice to save a few pennies on each set produced, it is impossible to eliminate the possibility of RFI.

A case for consideration.... I was very active in 2 meter SSB weak signal work, and used a 300 watt tube amp made by Command Electronics. The amp was very clean, and as good a model as was available to the amateur market. Living in a fringe area, many of the neighbors had preamps installed on their TV antenna systems (Satellite was not yet affordable by the masses). The Television spectrum covers from 50 MHz to near 1 GHz, and nearly all points in between, with the audio and video signal of each channel on different frequencies. To boost signals in the TV spectrum, a preamp must be able to amplify any signal between 50 MHz and 1 GHz, and without any discrimination against the frequencies in this range that don't host a TV signal. The preamp manufacturers are equally concerned with maximizing profit, and produce a ultra wideband preamp enclosed in a plastic shell. It can amplify signals received by the antenna or the circuit board equally as well. At this point is starts to become clear that any RF signal between 50 and 1000 MHz will interfere with TV reception, if it is of higher signal strength than the received station. Remember, all energy (with the exception of DC) has frequency. Can you guess what happens when a humming bird flies in the general area of the antenna/preamp "RF Vacumn system"? How about a car going down the road with one bad spark plug wire, or a neighbors blow dryer with a set of brushes on their last leg ?

One of my neighbors has just purchased a new TV, and had a respectable antenna system. He complained about interference, and his complaint times coincided with the entries in my log book, so I went to work. I first contacted the ARRL, and got the info in writing behind the ruling that the set must accept any signal it receives, thus negating legal intervention or FCC involvernent in RFI cases. Armed with this documentation, I met with my neighbor and made many attempts from tuned stub filters to even footing the billl for commercial band stop.bandpass filters. They had no effect. I took my small IC2SAT HT to his house, and found I could blank the TV with 2 watts, 1 watt and 100.mW. I then explained what a dummy load was and it's use in testing gear to prevent stray RF and interference. I proceeded to install a Commercial dummy load made by a company that he recognized the name and accepted that it should do the job. At 100 mW, with the dummy load

substituted, the HT still shut down the Brand New TV set. Since it was a recent purchase, I asked him if I could see the paperwork that came with it, which he produced. I showed him in writing the manufactures required disclaimer stating the consumer must accept any signal received by the set, and he began to see the light. I wasn't particullarily thrilled that it had come to that, and he made comment that he wanted to be able to enjoy his new $400.00 TV. I then invited him down to see my $3500.00 Amateur Triband all-mode satellite rig with automated and computer operated antennas, azmuth and elevation rotors and even down to the invoices for the price of the coax per foot as compared to his investment. At this point, the road forks to either a rational understanding that I had made the attempt, spent extra time and money when not required to, and that the TV set was far inferior in quality to the Ham rig, as specifically stated by the manufacturer. The other fork in the road was to pursue a course of irrational behavior that had no support from the legal system or the FCC.
I thern showed him my C band satellite TVRO outfit, and he saw that the quality of the piccture was better than anything he had seen in the last 10 years on any set in the area; even when I was operating in the next room. He asked for assistance in picking out a satellite rig, I helped him with that, helped pick out the site for the dish, provided him with contacts for programming and installation, and ended up with a goof friend out of the deal.

It doesn't always go like this., In fact it probably seldom happens this way. However, the situation is clearly outlined and the ground rules are clearly stated. RFI can be caused by many things when such a large spectrum is being utilized. It has finally been realized that the manufacturing industry will continue to produce products as cheaply as possible, and that the trade off is spectral integrity in the front end. With this type of equipment unleashed on the market it is virtually impossible to remove the chance of TVI problems arising.

No where in the documentation does it single out licensed, unlicensed, human or animal sources as responsible parties.

> In practice, it is wise to try to work things out with the neighbor, such
> as suggesting fixes for the problem - or agreeing to not operate during
> certain hours of the week.

This is the "right" thing to do, but it must include the understanding of the neighbor that you are acting on your own free will, and not due to any required action, either legal or implied. It all becomes a matter of calmly and politely laying the cards on the table first; explaining first that you are not required to correct their problems, and the mere purchase and setup of the equipment indicated that by the terms set out by the manufactirer that they were agreeing to accept any interference, as stated by the paperwork that came with the TV. Just because they didn't read, or didn't understand the disclaimer doesn't make you obligated in any way to correct their problems.,. After you get that out of the way, they will either become cooperative or hostile., If you stand your ground, and still make a sincere offer to help, there is no basis for them to have any compalint

against you.

There may be many opinions and interpretations of what the "law" is on TVI. I proceeded only after learning the facts, and came out with very few scratches and no casualties. If I had gone into this situation un-prepared, I could have just as easily forced myself off the air by claiming responsibility out of sheer ignorance or lack of understanding what I was working with.

Points to Ponder,

David

use a fender groove mount. they work real good and the two holes
it takes are down in the finder groove and out of sight

There is always more wattage in than out in any radio
system. Have you ever put an amp and volt meter on on the
power lines on a transceiver keyed up... you will more watts
going in than going out.
Cheers,
John

I guess you could call this a little survey, Ive been an avid c.b. collector for many years ive had just about everything you can imagine. My question is: What do you collectors out there consider to be the all time best c.b. base radio ever made? My personal best (in every-way) is the TRAM D 201A, These are the criteria I used to make my choice, (1)- Clairity of SSB, upper/lower., (2) purity of transmitted sound, (in all modes), (3) Duty cycle, (durability), (4)- authority in audio, (loudness in audio), and lastly: (5)- Ease of repairs, (most of the time its usually a soft or bad tube), their are exceptions like mod boards, or synthesizer boards, but these are NOT common problems. Any how I will be waiting for your responses, and once again-----Thank's. (sob--sideband omni broadcaster 1682)----------73

>
> --
> Bill Nelson (billn@peak.org)
The Constitution still allows Federal Law to overrule local courts, even "small claims" so the matter could have been taken to court of record. Before any "thing" is heard in a small claims court, the basic right to appeal is usually lost if a person doesn't challenge it and appeal the fact as being without merit or outside the venue and jurisdiction of the court. Once a person is served with notice by a "small claims" court, all he has to do is go to a court of record and injunct the court as being without merit or jurisdiction in the court. Lawyers might not be allowed in small calims, but they are in the Federal Courthouse all day long, even into the night.

This was tried in Louisiana many years ago and the Attorney General says if it is Federal, State Courts are without jurisdiction.

Um, the next phrase I'm having difficulty parsing, Jose.

> <....>front hot rear grounded????

Okay, I'm not following...

You have two antennae to tune -- the "front" antenna is a 'hot' antenna,
while the "rear" antenna is 'grounded' - you're attempting to make a
directional array with a reflector antenna, right?

I'm understanding the theory behind the reason, but I'll have to ask why do
you want your van so selective in only one direction?

EXCELLENT POST!!!!!! This shows genuine concern
for the neighbor and for your own hobby. Not only
did you show compassion for him, but you didn't
just throw the license down and say "Hey nothing you
can do, don't bother me" Some Ham's & CB'rs should
take a lesson from you.
I had a neighbor complained I was coming over his speakers, I threw a
tone carrier and saw that he always left the stereo on with the volume on
low, not much I could do for that. I showed him why when he left the volume
on low
all he was doing was creating an amplified antenna.
I had the same problem with him, with only the stock wattage on a radio,
and even installed caps to reduce the spurious RF. But still little RF was
getting through, so
I limited my hours to midday and late evenings to keep
harmony with thy neighbors.

My problem is I don't have a real bumper. Since there's so much fiberglass all over the body panels, I'm worried about drilling any type of holes because of cracking later on in life. I was thinking of the metal bar from the frame under the rear bumper. COuld use a firestick or adapt my Wilson 1000...

I'm open to any ideas or suggestions.

Greetings!

Got a VOM?

Take the power cord, and check the Negative lead to the CASE of the radio, the back panel will work...

Did you get any resistance? Should be about 4.7K at the least, to about 10K resistance [DC ohm].

Why?

The radios use an isolated chassis - works for both positive and negative ground ignitions. A side benefit is noise reduction and lessing on the effects of ground loop situations.

Yes you should ground that radio. Keep the ground lead short - to lesses the voltage drop and reduce problems with noise and RF leakage getting back to the radio or other places that don't like having their signals interfered with.

Why?

RF return.

Do you use a magnet mount antenna? Then is imperative that you mount the radio to chassis ground on the vehicle. To keep RF where it belongs - at the radio and the antenna, not everywhere else that can wreak havoc with both the vehcile electronics and squealing audio from a microphone.

The reason why that case is isolated - keeps ground loops from forming, and the way it's designed, it provides an RF short from the case of the radio, to the bracket or the metal that you'd use to mount the radio to the vehicle. This allows RF to transfer itself between the radio and the ground of the vehicle without the worry of DC ground loops adding to the noise.

On Thu, 16 Mar 2000 03:04:01 GMT, while the modem was pondering it's navel, jerev@my-deja.com dissertated the following:

I have a 122 that would break up on AM. I decided that the AM
regulator was overloaded. I bypassed the regulator to the final,
and it stopped breaking up. I also had to turn the AM power back
down. If I do the AMC mod, will it swing more? The audio cuts
back after a second, dropping 3 watts of swing. All I need is 3
watts of dead key and lots of drive. Thanks. You must be busy,
because I posted your link a month ago!

1684. Re: A few newbie questions

Newsgroup: rec.radio.cb
Date: 2000-04-15 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <38f8946b.7204433@news.iserv.net>
Source record: 31134

Greetings!

I'll try to answer the questions...one at a time...

On 20 Mar 2000 01:20:19 GMT, while the modem was pondering it's navel,
nospamplease-mbos@iastate.edu dissertated the following:

>1. I just had my cobra 18 wxst fixed and supposedly tuned at my local cb shop
>and the borrowed swr/power meter I was using showed only 2 watts on channel 17
>and then about 6 watts on channels 1-4. What is going on there?

Possible causes:

Tune the radio on the wrong channel, or caused by a poor tune
up, the power going to the network [those coils that filter
out the harmonics] is different when you change from opposite
ends in frequency, of the CB band. Channel 1 the network loads
at a different impedance than on Channel 40. This change in
input impedance to the network changes the power level
available going out the radio.

Tune done by the person was to get more power by possibly
swapping out components in the Driver and Final area of the
radio to help boost modulation. Done using wrong values.
Or they removed a component that kept the balance of power
for RF production consistient as you change the frequency.

Your antenna and your radio - may now have a different SWR
to each other. Not the fault of your antenna, this is caused
by messing around with the network just after the final to
cause a loading problem with a reactive load like your
antenna.

If they used a dummy load to gain power during the tune-up,
any reactive antenna anyone uses on that radio, will still
show a good SWR, only the impedance between the Driver and
Final stages are affected.

>2. I have now purchased my own swr/power meter and I don't have a 2 or 3 foot
>piece of coax to use to go between the radio and the meter but I have a piece
>that is 8 foot will that work instead of the other?

Any length will do, within reason - 8 feet is within the reasonable
length. For better accuracy and with less problems in handling and
losses, perhaps you can pick up a 2 to 3 foot length jumper at a later
time to help you manage the problem of checking SWR better.

Coax? Just as long as it's RG-58, RG-8x or any RG-8 type of coax that
is 50-52 ohms impedance - its stated on the cover/jacket of the coax
what the impedance is. CB radios need coax of 50-52 ohms impedance.

>3 I am thinking of uprading to an export radio and an amp any suggestions for
>these pieces to get the most bang for my buck?

Opinions vary, how much do you want to spend?

It can be as simple as a Palomar 225 with a Midland 77-115, on up to a
Galaxy 99 or Melaka, or RCI-2950 driving a Sweet Sixteen!

Just make sure that the piece of damp string that you use for the
antenna is capable of handling 200% of the wattage-rating for the
wattage of output of the amp you decide to drive that dixie cup of a
radio with.

Greetings!

Pills are what they look like, they are the power transistors inside
the amp.

When you look at them - they look like oversized asprins.

Some techs have mistaken them for the latter - although 4 out of 5
doctors don't recommend swallowing 2SC2879 for curing
headaches...we're still waiting for the opinion of that 5th doctor.
;-)

BUFFERIN=Releives operator headaches caused by small buffers.

Greetings!

Or you can obtain different values of small pF caps within 5-30pF
range and use a switch [SPDT] to allow you to toggle between the
standard trimmer for the regular channels and then swap in the proper
value you need to obtain the 10KHz slide. Last I checked, there were a
couple of ways people were doing it.

Some simply removed the paralled cap acorss the timmer to get the
in-between channels with a switch. This paralled cap is about 6 pF in
value, or you can use extra capacitance across this one to obtain the
results.

You have to experiement a little with the values needed, for each type
of PLL behaves differently when using capacitive loading in this
sensitive circuit.

Message-ID: <38f89e6f.9768529@news.iserv.net>
Source record: 31142

Greetings!

Since this question relaies on many variables...

How about we convert that "range" to S-units? It would be easier...

Figuring 6dB = 1 S-unit

If your friend hears you, and his radios meter is saying 3 S-units -
but the noise level is at or close to 2 S-units, you'd have a hard
time trying to talk to each other.

1 250 watt amp may give you about 3 - 6 dB gain in signal strength. Or
about 1 S-unit.

Considering the range - your friend would hear you better at that
location because he would see that you're anywheres between 3.5 to 4
S-units on his meter. Some radios would even show a 6 to 7 S-units
reading on their meter because of this simple power level change.

Whats does that have to do with range? It's relative.

It all depends on how well the other system can function with what you
send out.

Attempting to double the power, or even quadruple the power in dB -
you still have the problem with the relative conditions existing.

And with that power level, and using a reactive load, you you should
switch to RG-8 to handle the power level and improve the loss figures
to help you acheive and maintain the power level gain.

1694. Re: 102" mount?

Newsgroup: rec.radio.cb
Date: 2000-04-15 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <38f8a43b.11252973@news.iserv.net>
Source record: 31144

Greetings!

The easiest way to see if it will hold is to look at the number of
bolt holes the mount has.

A 4-hole right angle mount should be just fine.

The Toolbox would offer a ground - but not the best.

Any way that you could possibly run a braided strap from the box to
the cab or bed?

Else, upgrade to the 4 bolt type and drill the two extra holes needed
to support it and you'll be all set.

Source record: 31146

Greetings!

Ok, I've seen the replies...you need a counterpoise - or an RF ground.

Mobile antennas are designed for use with metal - like you vehicle. If you don't have any, well - you're having that problem now...

If your simple mobile antenna is not mounted to anything metal - the high SWR is because the metal that this mobile antenna is looking for is simply not there.

RF receive increases because of the ground wire - the ground wire has some metal that the antenna can use - but not enough to help lower SWR.

Since the antenna is old - not sure if it can even provide a good match even if it's on a car.

There are a couple of options....

Place the antenna on a coffee can and put the can into the ground half-way. Why? Earth ground with RF does affect SWR. If you're not looking into true performance - this is the easiest means to get a low SWR so you can at least use the radio. Even a old well-head or pipe can help get you up and using something - even though it's pretty much on the ground. You'd be surprized at how well an antenna can perform if you simply pound a pipe into the ground and use some ground wires made up with simple solid wire attached to the pipe and spread radially outward.

Use some old metal conduit [EMT or copper] of at least 8 feet in length and mount the antenna to it. This will provide some RF ground and a counterpoise to offer low SWR. The conduit needs to be a right angles to the antenna - e/g upside down "T" - so the antenna itself is upright.

Greetings!

The radio will being to "overload" on audio soon enough.

Try adjusting the values of the input capacitance to the Final.
Usually they use a 150pF and a 470pF paralleled - mess around with
these two values to get the right level of drive.

There is a diode located by the ext/PA speaker jacks that works with
the regulator - I simply added a 33K resistor to the diode lead to
improve the forward swing. Theres is also some other mods that deal
with the 473pF cap and that diode - to get a lot of swing - but I've
stayed with the 33K resistor to keep the radio more stock and less
likely to bleed from audio or over-modulation.

Redwire,
If your legal (4 watts), the distance to stay away from
a CB antenna is small enough that it's a bit silly to worry
about it. If your not legal, say running about 100 watts as
an example, you should stay about 10 feet away from the
antenna. If some one is near your mobile antenna, you really
shouldn't be transmitting anyway. This 'exposure' thing is
not concerned with occasional exposures to RF, but a frequent
exposure.
If you use a 'pocket' cell-phone you have more of a risk
from RF exposure than you do from a CB radio.
'Doc

75 ohm cable hardline can often be had for free at these lenghths and
works great.

Ben,
"You pays your money and you takes your choice!" It's
more a matter of how much you want to spend than which is
the 'best', after a certain point. On most HF frequencies
much more than a good grade of RG-213 is wasted. (Oooh,
theres gonna be indignant replies to that!)
As far as the neighbors are concerned, what little RF
is radiated from your feed line is going to be the least
of your worries (all things being equal). The RF from
the antenna is what will cause the problems, if any.

I have a Cobra 148 GTL, the model before Sound Tracker. It looks clean for the exception of bottom right hand corner is flattened instead of being square. It had fallen on the corner, but its not noticeable unless under inspection. The only mod this radio had was extra freqs and since has been removed back to stock. It has had no tweaks, peaks, or limiters removed.

Looking forward to any offers or trades.

They lied. An FL-2100, or any amp with a pair of 572B's will put out about 600 watts. Maybe more, maybe less, depending on the band. If you have 220V available you may get a little more.

1711. Re: whats the right way

Newsgroup: rec.radio.cb
Date: 2000-04-15 00:00:00 UTC
From: W5LZ <w5lz@oio.net>
Message-ID: <38F8B480.EC2DC25B@oio.net>
Source record: 31204

JVillafane,
Okay, I think I know what your asking after reading
Ken's reply.
First, do you have enough space to mount the antennas
18 feet apart? How about 9 feet apart? If you answer no
to either of these questions, forget trying to phase two
antennas. If they're mounted closer than 9 feet apart, it
won't work. The resulting antenna radiation pattern is
effectively omni-directional (don't gain nothing, save your
money).
If you answered 'yes' to the 9 feet question, then you
can have a bi-directional(2 directions) antenna system.
In 'real-life', this gains a mobile very little good. It's
'do-able', but most of the time the directional pattern
will be in exactly the wrong directions. If you really
want to do it, it requires an antenna switch, a couple of
'T's, and lots of coax. Or, a remote antenna switch and
a couple of 'T's, and about 2/3rds the coax of the first.
If you answered 'yes' to the 18 feet question, then
you can have a 'quad' directional(4-way) antenna system.
This is slightly better than a bi-directional, but will
take slightly more coax.
The radiation patterns of either of these two phased
antenna systems have very broad lobes. True, you do get
'some' gain, but it's very small, so small that I doubt
if anyone could tell the difference.
So, we're back to the question, "why would you want
to do it?".
'Doc

Charles,
You don't 'have' to drill any holes in the bumper. I guess I should have said a bumper 'chain' mount. The thing to remember is that you would have to run a ground strap to the car's chassis. The 'chain' mount is just a mechanical connection to the car, no electrical connection.
How now???

>
> Hello, I have a RCI-2980, I would like to Upgrade the AM detection...I
> do know i need to change D34 & D35 What do i change them to?

Schottky barrier diodes. NTE/ECG583 or SK9975.

I've done that mod; the difference isn't worth
the effort. The same goes for changing the
noise blanker diodes (D1 and D2; same change
as above), or changing the front-end transistor
(Q18; change to ECG23 or 2SC2026). I've done
all the receiver mods and a meticulous alignment
to my own 2950; the difference in receiver performance
between a stock unit and mine is maybe 10 to 15
percent. The basic 2950 receiver design just
isn't that good; minor mods won't correct that.

> I want to add talkback, is d80 the right location for this?

D78. Lift one side and run it through a switch.
Since the talkback volume isn't adjustable, you
won't want it on all the time. Also, changing
D115 to a .0047 cap improves the accuracy of
the talkback audio.

> Final stages are affected.

The last one is the most likely. An easier to understand
explanation is that SWR effects wattmeter readings. The
SWR on 17 is very likely to be different than it is on 1.

Another easy to understand explanation is that simple CB
wattmeters are usually significantly inaccurate, average-
reading meters that won't show peak power. The inaccuracy
changes with changes in SWR

> is 50-52 ohms impedance - its stated on the cover/jacket of the coax
> what the impedance is. CB radios need coax of 50-52 ohms impedance.

Buying or making a purely resistive, 50 ohm dummy
load is the thing to do if you want the most
accurate wattage readings your meter is capable of.

With a dummy load coax length doesn't matter.
When using an antenna as the load, coax length
as well as what channel you're on, and the
tuning of the antenna, all effect the wattage
measurement.

The goal is to tune the antenna system (coax
and antenna) to achieve the same readings as
you get with the dummy load. If your meter
has a field strength function, you can tune
for maximum field strength too.

I like the known performers; Galaxy, 2950, 2510,
Midland 79-290, etc. As for amps, stick with
the stable designs; Blue Face Palomar, Magnum,
Galaxy, Texas Star.

It takes some shopping to come up with a radio/
amp combo that enough but not too much.

> that meter band just 10-11 meters, do you think tubes are weak, everything
> else seems to be working good, thanks,73s Craig

The output depends on several variables:

The condition of the tubes.
The value of the line voltage under load.
Running on 110 or 220 VAC.
Level of input drive.
Type of wattmeter.
Type of input signal.
Type of output load when testing.

The amps with a pair of 572s that I've tested
with 100 watts in on an average 110 VAC line
produced 700 output watts using a dummy load
and a 5% accuracy meter.

Try www.firestick.com they have some mounts that fit between doors and hoods
etc. They require some mounting holes but these are small and in an area
that isn't noticeable.
Good Luck and get rid of the through the glass SWR is typically high and you
can damage your radio.

Handy Andy
>
> Did you get any resistance? Should be about 4.7K at the least, to
> about 10K resistance [DC ohm].

Really? I don't think so! If you get that much resistance
measuring from radio chassis to ground, you have a BIG problem.

> The radios use an isolated chassis - works for both positive and
> negative ground ignitions. A side benefit is noise reduction and
> lessing on the effects of ground loop situations.
without the worry of DC ground
> loops adding to the noise.

A DC gound loop? Are you sure? (learn something everyday!)
Does that mean I could have used that radio in my '51 F-1? I
didn't have to change to 12v(-) ground? Even if the antenna
was grounded via the 'braid'? Just exactly which radio is
this??
'Doc
PS - A '51 F-1 has a 6v(+) ground. Difference in voltage is no
problem, but the (+) ground stops you from using ANY modern
radio, floating ground or not.

I had a similar situation some years ago. Most people don't understand the mechanics of RF, of course, and they automatically think that it is the fault of YOUR radio set. I was politely informed by a neighbor that I was blanking out his TV and asked what could be done to fix it. I sprang for a couple of filters, installed them, and it mostly cured the trouble. I also explained the fact that TV and stereos are not made these days with proper filtering/RFI rejection. I, too, showed him my ham station with which he was impressed (not that it was so special, but he was interested in such things anyway being a tinkerer). By limiting my operation to late night mostly, I haven't had any complaints..... except for the satellite installer that saw my antenna and beligerently told me I would have to stop using my radio because "I" was interfering with his customer across the street. He was disappointed when he dis-covered that at the times the interference occurred, I was 25 miles away at work! LOL!

1731. Henry amp price?

Newsgroup: rec.radio.cb
Date: 2000-04-15 00:00:00 UTC
From: liv2cruise@aol.com
Message-ID: <20000415184703.26592.00000480@ng-cf1.aol.com>
Source record: 31224

This amp, 2KD-3 has 2 3-500zg tubes with only 15hrs on them. The amp is clean, 5 yrs old and seems to have been kept in excellent condition (so I'm told).
The price is $800 and he pays 1/2 shipping. I've looked around and that seems to be a reasonable price for it. There's a 2KD-5 for a little more but I don't know the difference between the two. I've e-mailed Henry re: the difference, but no answer.
Any info on either would be appreciated.
Thanks
Steve

Message-ID: <031ce197.bdb21205@usw-ex0104-026.remarq.com>
Source record: 31234

With all the talk about RF signals and health what is the now
accepted safe distance from transmitting antennas? When you're
in an auto with a CB you can be as little as 2 or 3 feet from the
antenna. What about the "inside base" antennas I see that just
plug into the back of a base antenna? If you have a modified
radio putting out say 75 to 100 watts are these things safe?

I am not arguing the law... I and just stating the
contradiction of the DX law and the nature of 11 meters.

If the other person has not identified his GTH, just his
call, and you ask where his GTH which turns out to be more
than 155.3 miles then you have already broken the law. How
are you going to know the location, and therefore the
distance, if it is initially not reported. A DX
communication then has already happened whaeather intended
or not. You are going to talk DX weather you like it or not
sometimes with out knowing it when the skip is strong.
Sometimes is is difficult to talk local by 1 mile due to
skip. I have had a single person, no other skip, come in
from the east like he was just down the road a bit.

There is just too many variables too nail one for DXing. I
like Dxing but it sure is a pain in the ass when I am trying
to communicate with base and mobile local, but as I said
before, that is the nature of 11 meters and no law will
change that.

1748. Ranger home page? RCI-2950/HR-2510

Newsgroup: rec.radio.cb
Date: 2000-04-15 00:00:00 UTC
From: Redwire <graydogsNOgrSPAM@yahoo.com.invalid>
Message-ID: <03f0f1f8.d5373229@usw-ex0104-026.remarq.com>
Source record: 31241

I have a Ranger 2950. Is there a home page on the net for ranger
radios?

I paid $289 for this radio new in box with all mods done (11
meters, peaked and tweeked, etc.) I have good luck with it when
DXing working most any state in U.S. and Canada and Mexico. Yet
I read a lot of negitive things about it on this news group.

Is the 2510 really that much better?

I ask this because a friend of mine wants to get into CB after
playing with mine for a few days. She can't make up her mind
whether to buy a new 2950 for the same price as mine ($289 with
mods) or buy a used HR-2510 for about $195. (no mods yet).

I frequent 3 different CB shops. Two of the three say she should
go with the 2950 because they are having problems getting
replacement parts for the 2510 lately. The third shop agrees that
he has had problems over the last year with long wait times on
replacement parts for the 2510 but still recomends the used 2510
over the new 2950 (even though he isn't selling the used 2510).

Anyone heard of a supply problem with 2510 parts? Is there really
that much difference between the performance of the two radios?

Thanks in advance for the help.

Ugh, let me see, cellphones and CBs are radios, right? Just on
opposite ends of the spectrum.

My original statement was to bring out the fact that "maximum distance"
is variable and there is NO garaunteed distance. One day you might talk
to a freind one mile away, the next someone who is 100 miles away.

I should know better than the post to rec.radio.cb

John Doe,
There' really no way of 'curing' the problem without
changing the wiring of the truck. The factory recomended
method is to electrically by-pass the fuel pump with a
capacitor to ground, to get rid of the noise. I sorta
doubt if a '94 is still in warranty, but you might ask
your local dealer what he knows about this(guess would
be nothing).
There are things you can do without changing wiring,
and I'd do them. These things will probably not cure
cure the noise completely(if at all).
'Doc

Sorry about that Chris....was a long day. Factory setting on my Eagle Sidewinder was 4 watts AM, and slightly under 11 watts FM. They probably have the increased power output on FM over AM even though both carriers are adjusted by the same pot to compensate for FM's lack of swing, building in a 7 watt output in the FM carrier over AM to get the FM carrier into the power range or at least closer to it that AM swings to.

1759. Re: What is safe distance from antenna

Newsgroup: rec.radio.cb
Date: 2000-04-16 00:00:00 UTC
From: Gary Danaher <gdanaher@home.com>
Message-ID: <38F92025.CDB8AFCA@home.com>
Source record: 31159

AM consists of a constant carrier so it is 100% duty cycle. In a thirty minute time period assuming you are on 10 minutes, off listening ten minutes, and then on again for 10 minutes, your average power out from a 100 watt radio is 67 watts. With that output, the safe distance from a vertical antenna emitting a signal on 27.3 MHz and exhibiting no gain is 3.54 feet in a controlled environment, and 7.85 feet in an uncontrolled environment. If mobile and the antenna is on the roof, the metal roof top acts both as a ground and as a shield so that level of RF is inconsequential. More power and yes, it eventually becomes a problem.

I plan on putting up a m105 on 50 ft of tower. It will have a run of approximately 90 to 100 feet from the tower to the house. Shielding is a important factor. I live in the country, but I do have neighbors within eye sight using TV anantennas, and satellite dishes. Most likely no amp will be used, but should handle at least 500 watts.
I'm open to any suggestion as to what is considered to be the best coax.
Please feel free to email me or respond to the ng.
Thanks
Ben

PS: I'll also be needing rotor wire for a Ham IV.

No, it is an -L- shaped bracket that screws into the inner groove of
your hood or trunk. It will have a 3/8" or 3/4" hole. In this you
install the mount - typically an NMO or 3/8"x24tpi. This way there are
no holes visible - even after removal. The down-side is that the antenna
pattern will not be as good as a center-roof installation.

It really depends upon who you ask. The law of diminishing returns
applies to coaxial cables. What I mean is that once you start spending
over a certain amount the gain per dollar diminishes greatly. That said,
I would not bother with anything better than Belden 9913, Cushcraft
Ultralink or LMR400 for your application. All of these cables are 100%
shielded and of high quality. I would not use RG58, RG8 or RG213 for
anything other than tying up my muffler or perhaps beating a dirty rug.

Just a slight correction. It ain't the volts that does it. After all,
static sparks are often in the 10,000 volt plus range. It is the current
that is the problem. Amplifier power supplies provide a lot of current.

Do you have the schematic? It should show it there clearly. The mic itself will have 2 wires and the ptt will open and close a circuit--likely 2 wires in. With 4 pins, that's about all you can do with it.

Belden RG213 would be a reasonable choice considering the length of the run, petential loss over distance, and quality of the coax, and finally price. Shielding is not an issue here with RFI in mind, but rather signal loss over the distance of the run. At 27 MHz it will be very minimal, but use a good brand such as Belden, and by all means, weather proof the outside connections.

If an incompetent tech peaked it for maximum power output, then it may
well be too narrow banded to have about the same output power across the
band.

As you noted later, the antenna could also be at fault. We would have to
know what the SWR was on channels 4 and 17.

1779. Tram D-201 Mark III

Newsgroup: rec.radio.cb
Date: 2000-04-16 00:00:00 UTC
From: andres <aortiz@mail.com>
Message-ID: <sfii08qhivv83@corp.supernews.com>
Source record: 31179

Is the golden eagle mark III a better radio than the tram D-201? I'm looking for a nice vintage radio but something that has good audio and recieve.

Thanks for any info

1780. Re: Grounding a mobile rig?

Newsgroup: rec.radio.cb

My uncle had the only well grounded cb radio I ever saw. It was installed in his John Deere tractor. This tractor had everything including a toilet and air conditioning. It had a sleeper and shower as well. When he was plowing the radio was well grounded to ground and we could talk almost anywhere during skip. He used a Shakespeare Thunderstick whip for antenna and a wide bottom plow for ground. It don't go over 20 plowing but the skip shooting sure is fun.

andres <aortiz@mail.com> wrote:
: Is the moonraker IV a good antenna for local and dx or just one of them?

It is far better for talking to distant stations. The problem with using
it locally is the directivity. The signal strength off the back and sides
is much lower than off the front.

Use an omnidirectional antenna for local communication, and save the beam
for the longer stuff.

... and my opinion is if you are going "2" write something, write the word, not a number.
Besides, the Magnum DF you mention is not a superior radio. I find the Grant and the 148 to be among the most popular, well-used and reliable models to date, and the DF to be a disappointment to many.

I enjoy my SSB CBing as much as anyone (I feel!) but I have to agree with many points here. First, there are plenty of CBers who constantly "invade" 10 and 12 meter freq's with complete bullshit. It's true and factual, and the amount of CBers with noisy, leaky, illegal (and entirely worthless!) amps is at an all time high.
BUT, the "law" regarding comm's beyond 155 miles is ludicrous. Not because of anything else EXCEPT the pointlessness of it. You might as well enact a law saying the sun will not set before a certain time of day. Like it or not, DX is going to happen on 27 MHz, even with a stock, clean, well-operated station.
Then again, the FCC's eradication of this ridiculous rule WOULD ALMOST CERTAINLY be construed by many in the CB hobby as a go-ahead for larger, leakier, noisier comm's. But since Class D CB is as forgotten a service as anything the FCC has forgotten about, why they are worried about MORE noise on the band is beyond me. It's like worrying about stepping in a puddle when your already in the ocean.
Any "answer" to the issue is bound to be a disappointment to some group or other. Point is, CB is a great service that is going very wrong for many... ham is a great service that is also going wrong for others. Cooperation, self-policing, understanding and unity are really ALL we have in our corner to keep our rights and our priveledges.
If we treated every right as a priveledge, we'd never lose either one.

2-6 54-88 Mhz with a 72-76 gap
7-13 174-216 Mhz
14-70 470-812 Mhz with 14-21 used for other purposes in major metros.
All are 6 MHz channels

OK, 50 to 800 MHz with gaps for commercial and ham RF creating services above, below and in between. A distinct lack of notch capability has been engineered into each product produced for consumer television usage on those gaps. I admit I was wrong.... I feel better knowing you were the only person on the planet reading the post who was able to find fault with it. Thanks for strengthening the content of my post by including this information. The other inaccuracy is that 70 through 83 were removed from the UHF spectrum with the advent of cellular phones; which also produce RF interference. This explains why old sets with tuners covering UHF plus the old 70 to 83 make some of the best cellular monitors legally available to the public with no allowable legal recourse for their use.

I chose to add some substance to the discussion, rather than firing pot-shots from the periphery because I didn't have anything to add to the discussion. I sincerely hope you feel better now; I sure do.

David

To further support this, the CQ-FLEXI 4XL is a flexible version having nearly the same characteristics as the 9913 types and introducing flexibility to the package, allowing usage with a rotor in a single length. I understand Belden has come out with a flexible version of 9913. The extra shielding do make a difference in getting the signal to and from the antenna.

OTOH, different manufacturers use varying degrees of shielding on their RG-8 product. Radio Shack RG-8 is often used for a paging backbone in multi-story buildings. It is hooked to an outside antenna that is resonant on the paging sub-band, and dropped down the elevator shaft, where it is terminated at the end. It's inherit leakage (due to poor shielding) allows pagers to receive signals inside a building where the normally may have difficulties due to the construction of the building blocking signals.

1797. Home made modile power noise filter

Newsgroup: rec.radio.cb
Date: 2000-04-16 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <38F99FC4.AE3D2528@island.net>
Source record: 31197

NOISE FILTER
Note if the car is in need of a tune-up this filter may not
get rid of much of the ignition noise.
Here is what you do. The filter I made measures 5" long x 4"
wide x 3" high.
Lets start with a rundown of parts:- 1- 2 electrolytic
capacitors 6500 UF each at 15 to 18 working volts.

If you can find one capacitor with 12000 to 20,000 UF OK but
you may need
to adjust the size of filter box. Get the Capacitors
first
because the size varies and will determine the filter box
size. my to
capacitors measure 3.25" X 1" diameter each. They
should have
a mounting bracket.

2- 1 ceramic disk.047
pf 100 V Cap.(capacitor),1 ceramic 5 pf 100v cap,
1 ceramic 180 pf
100v Cap., 1 0.5 mf cap, 1 electrolytic 5mf 50v Cap.
3- 1 1.2K Ohm 5 watt
resistor
4- 1 0.5" to 0.75" ID
ferrite core
5- 2 chassis mount PL
259 connectors like the type the antenna hooks on to
the back of the CB.
6- 1 chassis mount fuse
holder
7- 18 feet of #14 wire
that is used for winding electric motors
8- 5/8" X 5" (length
of the filter box) soft metal bar
9- 1 metal project box
from Radio Shack. 5" x 4" x 3"; wider if the
big capacitors are
larger than I mentioned earlier
10- 12v relay like they
use for fog lamps
11- 2 thick PVC or
nylon washers, 1.5" in Diameter X 3/17" thick (May have
to make)
12- 6" of thin 3/4"

heat shrink
you can get most of the
stuff at Radio Shack or your favorite electronic
surplus.
CONSTRUCTION
We need to make a choke out of the bar, motor wire, plastic
washers and heat shrink. Cut the 5/8" bar so that it and the
2 washers fit snugly into the _length_ of the box. Drill and
thread each end of the rod to take a 3/16" or #12 bolt. This
is to secure the choke to each end of the box. Heat shrink
the full length of the rod. Secure the plastic washers to
each end of the rod. Grove one of the washers to allow the
first winding to come to the top of the choke. If the
washers are thick enough you can angle drill for the wire on
a angle... this makes a neat exit. Now neatly, tightly and
uniformly wind the wire on the rod and from washer to
washer, do not overlap wire. You should get _about_ 3
layers. With a 1.5' lead out of the grooved or drilled
washer and a 6" lead from the top layer tape or heat shrink
the core in place, making sure that the windings _do not_
come loose. Drill the box for the screws in the rod and
secure in the center, bottom of the box as close as to the
bottom as the washers will let you. The core should be no
less that 0.5" from the bottom.
Over the grooved washer install the PL259 chassis
mount connector; on one of the 4 screws place a solder tag.
This is the _INPUT_ so mark it. Install the large
capacitor(s)... they should have a mount. Install the other
PL 259 chassis connector (at other end) with a solder tag
to... off to one side leaving room for the fuse holder to go
next to it. REMEMBER YOU HAVE TO HAVE ROOM TO GET IN TO
SOLDER LEADS AND LEAVE ROOM FOR THE LID AND SIDES SO THERE
ARE NO SHORTS ETC.!
Using #12 automotive wire wind as many turns through
the ferrite core as passable and connect one end to the
center conductor of the input connector and the other to the
choke lead. Trim leads for neatness. Connect the 5 watt 1k
ohm resistor from the center conductor to the solder tag
installed earlier. If you are using 2 large capacitors
connect the positive post to the IN center conductor and the
negative to the grounded solder tag. Use #16 automotive wire
for jumpers. Solder in place. At the other end connect the
choke lead to the center of the fuse holder lead, solder.
Connect a #14 jumper from the other fuse lead to the _OUT_
center conductor of the other PL259 chassis mount connector.
Also connect the other large capacitor positive lead to the
center conductor and other to ground (the solder tag). To
the center end (between the out center conductor or + lead)
and fuse holder and connect the other end of the .024pf,
5pf, 180pf, .05mf and to ground; connect the 5mf

electrolytic to the same way observing polarity. THIS FILTER IS FOR A NEGATIVE GROUND CAR IF POSITIVE REVERSE THE ELECTROLYTIC POLARITIES. Try to keep the wiring as short and neat as possible. To one of the screws of the choke attach about 14" of #10 auto wire using appropriate wire connectors. SOLDER ALL CRIMP ON CONNECTORS!

INSTALLING IN CAR
Using _#10_ auto wire run a lead directly from the battery to a spot where the lead from the filter to the CB will NOT be any longer than 2.5 feet. If you want the system to operate with the ignition key install the relay in a convent place. Attach the #10 wire attached to the choke screw to a GOOD car ground and use as short a lead as possible. NOTE #10 wire is used not for the sake of amps but to reduce RF loops. Resistance is considerably higher at RF than DC.

CONNECTING CB TO FILTER
After the filter has been tested, we will connect the CB to the Filter. For wire we will use RG8/u Mini. Or better yet, If you can find it is #14 shielded pair. Use as short as a length as possible an keep this run away from other wiring, especially parallel. Attach a PL 259 connector to one end of the RG8 and fix to filter output. If there is room in the back of the CB AND it does NOT disturb ANY wiring install a chassis mount 259 connector for the power in and mark RED well. If this is to difficult then run the RG8 power line to the last 1.5" of the power cord if it pugs into the back of the set, if the cord goes through the CB then connect and solder inside.

TIPS AND COMMENTS
I have used this in a Blazer, Caviler, Dodge And Neon, all have been kept tuned up. With out the filter I got some ignition noise and severe alternator and windshield wiper noise. All was stopped with this filter. I can't stress enough the importance of the neatness of ALL wiring and All automotive wiring other than the filter itself; use the proper connectors and terminals and solder ALL connections. Crimps only let in corrosion. Where there are bare wires that may short use heat shrink. The RG8/u mini is to insure the noise is not picked up between the filter and CB. This filter is not heavy enough to run a large RF amp. or linear, the choke wire would have to be #8 or 10 wire for any thing over up to a 100 watt.

Good luck and any questions... ask
John

Hello Ben: I have a 150 foot length of LMR400 running out my radio room, to my Garage, were I have a Penetrator 500. The base of the antenna is at 50 feet. It works great.

Going to run a 250 foot run to the barn in a short while, and up a 80 foot tower. I'll use LMR400 again.

I use RG58 to tie up bundles of tree braches for the trash dude.

Jay in the Mojave, ... just down the road ah ways from the fillin station.

Source record: 31251

Hello Andres: The Moonraker 4 will work great both for local and distant DX stations. I used on for more that 20 years, I miss having a great beam antenna.

The thing you half to do is assembly the antenna dead nuts on, as per the assembly instruction. And don't try adding more wires to the Moonraker Quad Reflector wire. It won't work, and will make a great beam antenna, a great omni antenna. I have run this on Elnec (a program for showing antenna parterres), and I haven't heard one guy say what a great improvement the extra wires made. Had one guy about 35 miles up the road take off the extra wires, and he said the beam came alive. It was just working as the design engineers planned to work.

When you get the Moonraker 4 is up, and SWR adjusted. Keep on eye on a local station that you know his location. Rotate the antenna around and write down the S-meter readings. As the antenna is rotated you will see significant changes in the S-meter readings, this will indicate the beam is working. When the beam is pointing at the local station, you will see a 9 to 10 dB increase in signal strength as compared to a 18 foot fiberglass antenna. Also notice that when the front of the beam is approx. 100 degrees away from the local stations direction, you will notice a -40 to -50 dB null, that is very sharp in degree's. This is great for nulling out a Bozo station you don't want to hear. The back of the antenna you will see a -20dB signal strength as compared to the front of the antenna.

As you rotate the Moonraker 4 around you will get a feel of how it works.

The higher the antenna, and farther away from tree's, buildings, and other antennas, the Moonraker will work better. But needs a good tower, rotator, and a good coax. I use LMR400 coax.

Hope this helps.

We have new ANDREWS 7/8" Hardline in stock that can be had for
alittle more money than LMR/400 cable. Attenuation @ 30Mhz
is .198dB at 100'. Compare that with an attenuation of 1.3dB for
the same length of 9913. Thats a 6:1 difference in efficiency,
and most of your TVI problems will go away.

For all you super serious guys, we have 1-5/8" Heliax with a
100' attenuation of .112dB @ 30Mhz, .252dB @ 150Mhz, and .451db
@ 450 Mhz.

Email us for more info. 73

I want to get a Davemade M-400. The radio I am using is a Cobra 25 that deadkeys 1 watt and peaks around 25.
Should I use a higher deadkey? I was thinking about getting a variable output installed on the radio.
Any suggestions would be appreciated.

You could go with a little higher dead key, but I
think you have it set up perfect now. With the
Cobra set up the way it is, you should get excellent
results from the Davemade, with lots of swing.

I don't think it is a laziness thing, I think a lot of it is the fact that 50% of the amateurs are snobby to CBer's, I know with the CB you can be who you want to be, and still follow the role of a "quality operator". Some guys like to talk on the bowl, some on channels 37,38,39 using SSB mode. To each his own. I like it that way. It allows a person to have "character". I do believe in rule to a point. I don't believe one should run trashy, spurious equipment by know means. I believe if one is causing RFI or TVI he should be forced to fix the problem on his end within limitation. I don't like the 4 watt rule, but rules are rules. I cannot change that rule but I can try to better the hobby by helping people operate in a clean manner, I personally operate my station within limitations and don't use any funny channels. But occasionally I like to drag race my radio for a couple of seconds and it is shame that something that exiting has to be governed...

>signals.

Sorry, but this is not completely true. The cable you are
describing is called RADIAX. RADIAX intentionally allows RF to
penetrate its shielding for the use in buildings, tunnels, and
applications where RF is naturally attenuated. RG-8, from an
engineering standpoint, would never be used for such an
application because RG-8 does not leak proportionatly along its
axis, and it would be impossible to design any antenna/paging
system based on this fact. Whereas RADIAX does leak RF uniformly
along its axis, which makes intended relative field calculations
simple.

Im not saying that no company wouldnt ever use RG-8 for the
application you descibed, however, depending on the size of the
building, its application would not be a very wise or cost
effective endeavor.

If cber's showed some amount of responsibility and regard for the rules,
hams might not be so "snobby" as you say. Look around, I am sure there
are certain people you had just as soon not have as a next door
neighbor.

Source record: 31279

The REAL problem is that, in the beginning, the FCC probably had an unrealistic expectation that people would not play with their toys. They established low power rules on a band better suited for long haul communications. Having said that, some people in this world try to follow the rules, regardless how inane, and others just don't try if they feel they won't get caught. It's a matter of ethics. Couple that with the fact that we seem to live in the 'me' age, that we all deserve stuff just 'cause', and forget about earning anything. CB by rule, was set up as a closed service--nobody needs to know how to tweak the radio, so stay out of the box. Keep the signal local, so reduce the strength to the minimum. Keep the antennas low. Even when a license was required, there was no associated test that went along with it--just a means of keeping track of folks. The snobbishness you see in amateurs is likely misunderstood. Licensed amateurs get blamed for everything that seems to happen to everyone's electronic equipment. FCC tests have shown that even out of the box compliant CBs can mess up a good TV set. When you add all of the illegal modifications (they are illegal because they are prohibited--no, not the same as murder, but illegal nonetheless), they tend to do a real job on the neighbor's electronics, and who gets blamed? Since the CB operator has done little more than take his radio to a 'shop' to be 'tuned', and then attached a fine quality linear to it, he likely has no understanding of the dynamics involved. Then the CB op, not happy with his 40 channels, wants to go up and down until he stomps on the other services, and FINALLY, he wants to know why the amateurs come in to this news group and gripe about what he does. This friend is called chutzpah. (Chutzpah defined: a teenage boy kills his parents in cold blood, is arrested and tried. At the trial, he pleads for mercy because he is an orphan.) Amateurs really don't care what goes on within those 40 legal channels. When the guy gets out of those and starts wandering away, then that affects other people. Keep the CB to the CB frequencies, and you will never have a problem with an amateur.

Gary, RG213 would be a reasonable choice to be sure. However, the difference in price betwixt Belden's RG213 equivalent and Times Microwave's LMR400 is almost nothing. Now compare the losses. You'll find there is a significant difference. If it is the very best you want, then I agree with the other poster that you should consider Andrew Heliax brand - available in diameters up to 6" - and beyond. I believe that 1/2" heliax is more than four times the cost of LMR400.

There is quite a difference between coax cable brands. Some of the el-cheapo Asian ones are absolutely dreadful. Remember, -RG- numbers are defunct. In fact, the only place you still see them is on RG58a/u cables. Anyone still using them is probably not making high-quality cables and they should be considered suspect immediately. I really like Cushcraft Ultralink (RG58 equivalent) for mobile installs on any frequency. It is 50 Ohms with a braided shield on top of a foil wrap in a UV proof & waterproof jacket. Just to top things off the dialetric is teflon so there is no chance of melting it either with the soldering iron or anything hot it is routed near.

MC

This is truly misleading on three accounts: the 6:1 comparison, the TVI
and also the cost.

John:
Yes, the 2510 IS a LOT better. Picks up a lot less bleed over, that's why I quit selling them. I have 2 good used 2510's now fs. I have NO problems getting parts. You won't need parts if your antenna is matched and/or no other antenna problems, AND you don't use coax MADE IN RED CHINA. Do you want a battery in your radio, that needs replaced every 3 years? If you don't want that hassle too, then you won't get a 2950. I quit selling them a long time ago when I found out about the lousy designed receiver that picks up the bleed. The new 2510 is called a Lincoln. Same thing, more $$$$, 2 buttons different color. 2510's are noi longer available brand new. You WILL be happier with a 2510 !!!
Dave!!!

Message-ID: <c9mK4.7984$Bt.136539@typhoon1.kc.rr.com>
Source record: 31286

I ordered a RCI 2950HP and a Cobra Magnum Palomar amp...can someone tell me the size of the amp. Also how much hot does the amp get? I am installing these in a '98 Dodge Ram and under-the-dash is really busy..I want to built a "hump" mount for both the set on. I am planning on making it out of wood then running a ground strap from both the amp and radio to ground. If heat is a problem I am thinking a adding a couple of 12 muffin fans to help extract heat. I know that heat is the enemy and I am trying to keep it at bay! If anyne has a better suggestion please lemme know.

Thanks...and if it sounds like I am rambling its cause I am barely awake :)

Billy Eitner:
It ain't your opinion, it is FACT ! The NEW 148's are made in RED Communist China now, which makes it 1 more reason to buy the Grant, that is made where they made the older 148's when quality was a concern of Cobra instead of "big" $$$$ is today by most of the big corporate NERDS (and I mean EVERY corporation, from truckstops to CB radio companies)!!!! I sold (& still have some) JIL SSB M6's which were the same as a Lafayette Telsat SSB 140's, which I think are better than 2000's! Hey, get it? NO 2000's are made in 2000!!! Dave!!!!!!!!!!!!!!!

Bill Eitner wrote in message <38F8D08D.A5B164EA@netzero.net>...
Keith Elkin wrote:

> anymore? How about in a mobil version?

Yes. The Cobra 148 and Uniden (President) Grant
use the same main board with a few minor changes.
These days the Uniden Grant is the better choice
in my opinion.

A photocopy would be great! Any pointers on the operation of this
radio would also be appreciated.

Sorry you took it that way. You will note, BTW, that I did only spec the
freqs thru 70.
The original poster seemed to know about stub filters and a few other dirty
tricks that might have been suggested had he not shown signs of technical
competence. You will note that the post was directed to a reply that
suggested that broadcast TV ended in the 300s somewhere and you were full of
it. If a simple statement of fact is a potshot, so be it. TV tuners are
required by Act of Congress to cover 2-83 and that is still true today.
When we put in our deficient digital mode here pretty soon, the TV sets will
still have to have 2-83 unless our illustrious Congress gets off its its
dead can. Again, no intent to potshot anyone.

Source record: 31293

I just bought a Superstar Turbo, plugged it into the cigarette lighter, threw the Wilson magnetic mount on top of the truck, and tested it out. It's great.. Till I start the car. I get a loud whining noise which makes it impossible to hear ANYTHING, and it gets worse when I accelerate. Even when the car is idle the noise is unbearable. Any suggestions?

-Keith

I really like this radio due to the size. I also have a Cobra 25 xl st
that I also use and it has less engine noise but is too big for my use.
I have the power wire coming straight from the battery but the noise is
awful. I have a good ground for the radio to the chasis of my car. What
can I do to eliminate this noise problem HELP !!!!

Source record: 31298

Also consider the price for 2 connectors for the heliax may cost more than your rig, and the loss that MAY be created by the need for flex cable at either end may far over come the advantage of using it. I have 100 feet of 1 5/8" free to anyone wanting to come get it. However, I must warn you that Rohn 25G may not be able to support it unless you place a run on all three legs to equalize the weight. Also, a serious block and tackle may be required to get it to the top; if it doesn't pull the tower over in the process. It is NOT to be installed on existing unsupported towers, unless it is pulled up by some other means of support.

This reminds me of the way our government will spend millions of the dollars that we are not able to keep from our paychecks to repair out of date technology; "The triumph of spare parts availability over common sense..."

My offer on the 1 5/8" heliax is sincere.... I will give it away to anyone willing to come to Brunswick, GA and pick it up. My only request is that you be willing to pay a modest and extremely reasonable price for the tower standoff hardware that I have to go with it (3 boxes). By reasonable, I would consider .20 on the dollar of current retail price Better count on a 4 X 8 foot trailer at a minimum to haul it, or a 3/4 to 1 ton pickup..... Also, set aside around $ 150.00 to $ 200.00 to put connectors on either end....

Don't you all agree that this is the most practical cable to use on Your CB antenna??

David

Source record: 31301

I think some of the reasons CB was set up where and as it was was cost, size of equipment, and the technology that existed at the time. Lots of VHF/UHF stuff was awfully bulky--even the CB radios of the day were large and high current draw. Lots of the old radios of all kinds required dynamotors to provide the HV to the plates for 12V operation. Then, too, you must consider that people in the '50s were much more law-abiding than today, so those that came up with the concept of a Citizens Band could not forsee the kinds of outlaw operations that exist today. Prior to the '70s, CB was LOTS of fun the way it was. People signed on and off with their callsigns, identified regularly, and most conversations I remember were plain dress with none of the "cutesy" phrases and inane noises such as beeps, squeaks, music, squawks and fart sounds that one is likely to hear now. In the moral atmosphere of 35-40 years ago, it was unheard of to hear profane language on the CB. As I recall, I don't remember the hostility between hams and CBers we have now. I am a ham, and still a CBer, and I have none of that animosity. It is, for me, like the taste of broccoli or spinach--just a matter of preference: I happen to prefer the ham bands, that's all. That began to happen when CB changed from the orderly, regulated, useful service to what it is today. On the other hand, recently I heard a conversation on Channel 1 about fishing. Two guys, one on one, were having a very intelligent conversation about fishing. I haven't fished in years and had lost interest. BUT these guys were amateur experts in that field, had lots of good ideas and experiences to share with one another, and it caught my interest. I listened to them for over an hour sharing ideas and helpful hints about equipment to make the experience of fishing better. I can't get interested in repetitive phrases, noise toys which make me wonder about the maturity of the people using them, and echo that goes on and on and on. I can't listen to transmissions that are so amplified, so over-modulated and garbled I can't understand them. I also find immature behavior on the ham bands, too, and I avoid those who engage in slander, silly sayings, slurs, and profanity. But does that make me some kind of ogre because I am a ham? No. It's just that ham radio offers me MORE than the chance to jabber endlessly on a radio. It offers me a chance to LEARN more and DO more. And I can do that legally, do it without running mega-watts, and/or bothering my neighbors. Even with clean amplifiers, on the rare times I use them, I can resolve any problems with the technical knowledge that amateur radio has given me--and I ain't a Know-it-all, either. There is SO much more for me to learn from experimenting, building things, constructing antenas, as well as talking to people in other parts of the world, and ham radio opened that door for me. If I create a problem for anyone, I will apologize immediately, and cease operation until I find the solution. Whatever band I am using, CB or ham, I try to be a good neighbor to all.

Big power isn't necessary. For lots of people it is a I-Am-Bigger-Than-You thing. I mean, I talked to Biel, Switzerland yesterday with 50 watts on 12 meters. How would BIG POWER have helped me?

There is a place for CBers and hams. I wish we could find a happy medium and get along.

Respect to All,

Jerry
K4KWH

1853. Re: Tram D-201 Mark III

Newsgroup: rec.radio.cb
Date: 2000-04-16 00:00:00 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <8dd02d$sg4$1@slb2.atl.mindspring.net>
Source record: 31303

For SSB use the Tram is perhaps the best commercial 11 meter offering. The only warning would be about possible oxidation potential on the Molex-type interconnects for the PCBs. For AM only, I would consider the Browning Golden Eagle Mark II. Something about that Collins mechanical filter used in the receiver that makes me believe it is good quality and that the development team was dedicated to producing a good product.

In truly esoteric circles I tend to like the ARF2001 as one of the best overall performers. It's construction and design compared to other commercial CB offerings can be compared to the design complexity that a military jet has; "A Gnat built to Government Specs." I have it, and have had the full CPI line-up. I have yet to snag a Stoner Pro for evaluation, but there is still time ahead for that.

The Alinco DX-70T(H) has better AM modulation characteristics than any other contemporary ham offering I have seen or heard testimony on. It is priced comparable to a Mint Tram, Browning, CPI or ARF product, and comes with a warranty. Of course, it's SSB performance will leave those far behind.

Chris,

Good advice. He might also try putting a bypass capacitor across the power leads on the alternator. Another thing is to remove the antenna from the base, or take it loose from the rig and see if the noise is still there. If it is, then it is following wiring into the radio. If not it is being radiated into the air where the antenna is receiving it. Take the radio out from under the dash and move it around in the cab. If it is close to the computer diagnostic plug, the noise might be getting into the rig if it is located close to it. I had one to baffle me like that once and I found it accidentally when I moved the radio away from the plug. I found noise on another vehicle that was radiating from the taillight filaments, and put metal screen door wire inside the lenses, grounding it which stopped the racket.

And, as you said, ground everything he can think of; hood, hatch lid, radio chassis, mufflers with SHORTEST leads possible. Grounds can be-come resonant and if it happens to be 27 MHZ, well.....

That is noted, however 70 through 83 adjoin the TV spectrum and the antennas
and preamps available are not able to notch signals above, below or within
the spectrum that is used by TV channels. This the essence of the original
post, of which I was the author.

> The original poster seemed to know about stub filters and a few other
dirty
> tricks that might have been suggested had he not shown signs of technical

> suggested that broadcast TV ended in the 300s somewhere and you were full
of

Not I. I fired a shot from the hip from past experience when I did the
research to see the spectrum I would have to avoid to eliminate any
possiility of generating TVI. When I found out the spectrum covered from
just above DC to just below dayliight, I decided my goal was futile at best
and some knowledge of what I was up against was in order. I should have
been more specific by quoting the band edges, but I took the same path the

antenna and preamp mfgs. took and treated it as a continuous area of spectrum; as it was that issue that was germain to the original subject.

> it. If a simple statement of fact is a potshot, so be it. TV tuners are

I can appreciate your comment, to a degree. I don't know if you remember Catch 22 when the leg was receiving great attention and the stomach wound was fatal and receiving no attention. It is much like the "Pay no attentiion to the man behind the curtain" from the Wizard of Oz. I was trying to stay on target with the discussion, and could have written a few hundred more pages if my goal had been to totally discount any chance of nth degree scruitany.

I don't think 70 thru 83 are available on any sets made today, and have not been since the ECPA was first unleashed on the public.
I could be wrong on that, but my instincts tell me that I am not. Think about it. 70 through 83 cover most of the area that AMPS/NAMPS cell sites operate within. We have a justice system that will lock someone away for reporting a conversation in which killling or robbery are being planned; if it was monitored as originating from a cell phone. There have been no-nock raids with storm troopers bearing automatic weapons on long-established business who carry FM wirless broadcast gear, scanner modification info and 100 mW FM transmitters. You can get locked up for selling, modifying or using a scanner that can monitor cellular (ECPA). WIth that in mind, doesn't the concept of a commercially available monitor equipment that can be purchased by the consumer market that comes stock with frequency agility in the forbidden zone kind of fly in the face of the agencies seeking to aggressively limit any access to those frequencies by the public?

At some point, common sense has to kick in to show the overall humor and idiocy of the whole situation. I fear the discussion won't end here. I am sure someone will be able to point out some other minor inaccuracy or spelling error, and divert focus from the original point of discussion. I have been guilty of such in the past too.

kal4cu,
First, disconnect the antenna from the radio, with
the motor running. If the noise is still there, then
the noise is getting 'in' by way of the power lead (probably).
If the noise disapears, then it's getting 'in' through
the antenna.(the 'fix' for either circumstance is almost
the same, but it helps to know where the noise 'gets in')
Noise geting to the radio by way of the power lead
means that you must 'filter' the power lead just like you
have to with a power supply. Place a fairly large capacitor
from the (+) lead to ground, as close to the radio as you
can get it (capacitor should be rated for at least 50 volts
and fairly high capacitance.) Did that get rid of the noise,
or at least help? If not, add a 'choke' in-line with the
power lead (Radio Shack used to carry them, no idea if they
still do). Cure the noise, or at least help?
Now the fun part. You didn't say the year of your car.
If it's a late model, it may have the fuel pump in the
fuel tank. If so, the power lead going to the fuel pump
needs to be by-passed with a capacitor (see factory mod.).
There's NO easy way to do that (do you REALLY mind the
noise that much?). This by-pass capacitor needs to be as
close to the pump as possible (meaning AT the pump). You
start by 'dropping' the gas tank... and right here is where
you probably said "to hell with it!". Sorry 'bout that.
Try what your willing to do, and hope for the best.

It is a DSB Surpressed carrier rig. It should not tune up any higher than 2.6 watts dead key. If it does, look for "Straps" in the final output circuit. (Low resistance ceramic 3 to 5 watt power resistors). It should tune up to around 2 to 2.5 watts, and the front panel knob will correct any tuning necessary when changing channels. It is one of the few rigs that you could use a device like the Wawasee JB-12 and still remain in the boundaries of 5 watts dead key. However when you applied modulation you could see a drastic increase in output power. As it came stock, it could provide over 10 watts with voice over the 2.5 watt dead key. Olson Electronics put out a version of this unit also. If you want to really have some fun, use a D-104 and a small modulator with this radio to "ride the carrier" of those local multi KW outfits and arrive at the destination on top of their signal, with your voice being heard over theirs.

It's a keeper. If you decide to part with it, give me first shot. I may have some barter items that would interest you.

4. By-pass the altinator
5. If newer car, by-pass the electrical fuel pump
6. Ground all body panels to chassis ground (see #2)
7. By-pass power lead to radio + #3
8. Disconnect antenna from radio. Still hear noise?
A. If 'no' then go to #9
B. If 'yes', then re-do or continue with #6
(should'a done #8 to start with...oh well)
9. Forget the radio, take up knitting.

Thanks Jay,

It was from the hip. I have Tessco and Hutton catalogs here and could have gotten to the penny.

This is some large coax. The roll loops are near 5' when taken off the roll and then rolled up for storage. A PCS cell site was erected adjacent to my place, and this was a "Scrap" left from a roll. I offered to clean up the site when they were leaving, and reaped the spoils; which I have no need for. I use Flexi 4XL, 9913 and Andrews 1/2" hard-line for 50 MHz and above operation. I am lax on 11m, with an Antron at 40' and RG-8. I just want to keep in touch with the locals. Got tired of contesting, working pileups and mailing out QSL cards to the tune of $ 60.00 to $ 100.00 postage after every band opening on 2, 6, 1 1/4 meters or 70 cm.

<<Whatever band I am using, CB or ham, I try to be a good neighbor to all.>>

Yes, well said, Jerry.

<< twistedhed@webtv.net >>
<< When one runs the freeband and talks BELOW 28.000 but ABOVE 26.000, it doesn't have a damn thing to do with hams. >>

I must note that this post appears to suggest that an "isolationist" stance on the part of hams would better serve the freebanders purposes. Indeed it likely would. May I point out that this complaint has a marked similarity to the attitudes of purse-snatchers and street criminals who depend on bypassers and neighbors "not to get involved", and are quite genuinely perplexed and angry when they do.

Probably the scairdest I have ever been was working a Coast guard emergency, as the only contact between a vessel in distress via CB and the coast guard by phone in the early 70's and with no license.... I was sure that I was going to jail after the rescue for unlawful use..... Found out a neat little rule of law; there are no unauthorized frequencies in times of emergency... I was 16 at the time.....

Those were the good ole days... 5 watts, low antenna and straining to talk local for the max. distance, while telling the 30 over S-9 signals from other states that it was illegal for me to talk with them while giving my address in case they cared to discuss it further via a post card and US Mail.

rgray,
Make sure the ground is large enough! 3 or 4 inch
copper 'flashing' works well, or #2 welding cable. I
know it sounds like over-kill, but it isn't.
Extra cooling with the fans can't hurt. Running the
A/C to cool your feet would help too. Mount fan(s) from
1 to 2 inches above heat-sink. Blow air ON TO heat-sink.
Just for 'grins' 'cause you didn't say, a magnet-
mount antenna is only 'good' for up to about 100 watts.
After 100 watts, things start getting 'squierlly' with
SWR etc.

You are entirely correct about Radiax and it's design. However, for a real-life point of view, ask someone in the biz what they do when radiax is not available, or the job is overbudget. Then ask someone who has sweep capabilities for checking coax what their past results have been when checking Tandy RG-8 as opposed to other RG-8 coax in the market. I think you will be surprised. An who knows, maybe they now have their act together. Tandy Wire and Cable is a big enterprise, and may have had some troubles in the early stages of wire manufacturer that caused them to put RG-8 with inferior shielding on the market. However, it's presence then, and possibly now is a known fact; trust me.... This particular tidbit was provided by Novel when I went to their school for my CNE. (Certified Novel Engineer). It may be entirely anecdotal in content, but my past experience with that brand lead me to believe that they had fairly good proof from the field, since every copy of Novel Networking software could only be purchased and installed by their CNEs and all support for the software and installation emanated from the hub that passed the story along to their classes as a warning on site preparation.

David

Now Y'all hold on thar!

Us southerners wanna ask you a question since we 'uns is so dumb and all. How many times has NYC gone BROKE? How many Northern Railroads is gone broke? When Penn Central was reorganized into Conrail, them yanks made such a mess, they had to get a feller by the name of Stanley Crane to come up thar and show them thar fellers how to run a RR. LOL! He was that feller that used to run SOUTHERN Railway. That railroad was the one that was on the list of top ten corporations for eons, finally merged with Norfolk & Western and BOUGHT Conrail along with CSX-one of them other southern-based railroad, both of which have never gone broke. I ain't ever heered tell of any southern city that went broke, either. We southerners are SO dumb, most states in these h'yar parts have laws agin runnin' a deficit in gover-mint. (Spit-tooey!) My mouth was a-gittin' fulluh 'backer juice. I was a-feered hit might git down in my ovuh-halls thar! Them thar yankees keep a-comin' down heah in such droves, I jist wonder iffen hit keeps up, who's a-gonna be left to turn out the lights in Noo Yawk!

Doc:
IS that why I feel the brain cells being attacked (a tingle) when I put my digital phone up to my ear, but when I use my 108" whip on the back of the car, I feel NO PAIN ? I say HUG yo CB antenna & luv that 27 Megacycles!!!!!
Dave!!!!!!!!!!!!!!!!!

W5LZ wrote in message <38F945E7.388C4C3D@oio.net>...

Redwire,
If your legal (4 watts), the distance to stay away from
a CB antenna is small enough that it's a bit silly to worry
about it. If your not legal, say running about 100 watts as
an example, you should stay about 10 feet away from the
antenna. If some one is near your mobile antenna, you really
shouldn't be transmitting anyway. This 'exposure' thing is
not concerned with occasional exposures to RF, but a frequent
exposure.
If you use a 'pocket' cell-phone you have more of a risk
from RF exposure than you do from a CB radio.
'Doc

Poor analogy. A freebander is not intentionally hurting anyone. I empathize with the folks that say the law is the law no matter......But to choose to not take a totalitarian approach when one infracts the rule does not equate the mentality you are suggesting of "it does not affect me so let it be," for the reason stated above.

(2) rare Hy-Gain Model 640 "Footlocker" mobile tube
10/11-meter amps. (for those who know- I may be posting the 2-piece, AC and DC supplies version of the Hygains soon. I have both supplies and 2 or 3 rf heads) Much higher quality than the standard little sweep tube amps. Use a pair of industrial 8908 sweep tubes (very heavy duty- last ages under heavy use) for approaching 300 watts pep. One of these has a custom-built remote control head w/ illuminated switches and backlit rf meter and custom heavy-duty long harness for mobile installation. Harness contains control cable, 6 awg dc cable, and quality rf cable for transmitter-amp connection, w/ silver-plated Amphenol connectors. Harness is jacketed in heavy heat-shrink. Custom one has cont-duty starter-type solenoid for key relay. $150 and $250 OBO for the custom one. Palomar 310M mobile tube amp, excellent cond., functioning unknown. $200 OBO. Beautiful Golden Falcon 400 mobile
tube amp, custom flip-top case, w/ fan and backlit meter. Heavy key relay and power wiring. New tubes, 6 new 4048 transistors. Excellent cond. Believed working fine. $300 OBO. I don't have time to mess with these so all are sold as-is.

Greetings!

How long have you been in radio?

I think you need to rediscover CB's...

Many of the Cobra and Uniden - as well as the older styles of
Midlands, use an DC isolated chassis design.

The Power supply is insulated from the chassis - and the chassis uses
RF coupling to block DC at the case. For specific reasons mentioned
before.

The power supply in these radios is designed to show a high-impedance
path for RF return - keeping RF out of sections you don't want it to
go to.

Since the radio type was never mentioned - they did ask a legitmate
question regarding how to ground a radio. Some radios require the use
of the negative lead to offer the return for the power supply to even
work. Cobra; 148, 21, 25, 29, 33, 138, 146, Uniden; PC-122, Pro-640e
[any PA-122 based board] Washington, Grant XL, Midland; 77-160, 100m
[any pre-1990 style board] - all the above listed is just a small
portion of the sheer number of models that use DC blocked case designs
for use in negative or positive ground ignitions. Thats the main
reason, so they work in those vehicles - when wired properly.

A secondary reason would be to reduce potentials that do
exist in a vehicles own ground from Frame or Engine, to
a door panel or dashboard truss to battery ground.

A few tenths or even a few millivolts can induce tons of
hash and whine that even the best power supply filter can't
filter out. It's in the ground plane of the board and you
can't git rid of it easily without some modifications.

Many radios [read: cheap ones] no longer require the use of the ground
lead on the power cord, the ground is the case.

I just snip off the negative wire and in these designs - I simply use
the bracket mounted to the vehicle to provide a good ground a less
noise. The bracket provides the common point ground.

I don't need to run the ground wire on these radios - in fact running
any length or wire for ground on these radios can induce a noisy
ground from the wire itself going to a spot on the vehicle is a
slightly different ground potential than the coax ground on a
permament mount.

Most people don't use a permament mount, which is sad - because you
get postings from people, similar to what started this original
thread.

On Sat, 15 Apr 2000 12:46:14 -0500, while the modem was pondering it's

>PS - A '51 F-1 has a 6v(+) ground. Difference in voltage is no
> problem, but the (+) ground stops you from using ANY modern
> radio, floating ground or not.

I think you may already know that answer to the question...

If you've read the radios owners manual - you will note that it
plainly states that it needs to be powered within a given range of
voltage - 13.8 volts being the nominal.

Unfortunately - this places your F-1 out of that catagory. You have to
supply a separate means to power the radio if you want to use it in
your truck.

Source record: 31346

Greetings!

Time to make some decisions...I'm going to be honest with you. Not as a flame, only that I see messages like this in my mailbox all the time and I think it deserves to be known there are a couple of missing key points...

First...

Well, you didn't tell us how the antenna is mounted, or what you're using for the antenna...

A good rule of thumb is to place the antenna on the roof away from the trunk, or hood. This helps give some distance between the antenna and the noise.

A permament mount works better at reducing noise and improve performance - at a price.

You should always locate both the radio and the antenna away from any noise sources; Dashboard, Gas tank/fuel pump, engine block, defroster/blower motor or even the windshield wiper motors. All the above are good sources of noise to make your radios day.

I mentioned antennas because it's the often-most overlooked aspect of the CB radio world.

A 5 foot antenna, compared to a 3 foot model, will have a much better receive and transmit performance gain. While you may have the same noise level, you still have a much better system using the longest antenna that is acceptable to you and your vehicle.

You can always RF gain-down or Squelch out noise, you still have better signal strength for reception and can talk for longer distances using an antenna that is closer to the 102" length.

In CB's longer is better, and location of what you use also plays a major role in keeping down noise and enjoyment level high.

If you spend a little more time and money on a good antenna and perhaps a little less on the ego trip of the value of the vehicle - any radio, no matter how cheap, will work better than your inital expectations.

At last check, the Pro-510 can be used in a Positive or Negative ground ignition system - so it has a special consideration for power

routing.

Try this, if you haven't already done so. Mount the bracket
to a good ground spot - checking resistance back to the
battery ground cable. It should be less than .7 ohms for
best performance. If you don't get a low resistance reading,
check and re-check, or have someone do that for you - to
make sure that the battery cable ground to frame and chassis
as well as engine block - are the best [lowest resistance or
about .4 ohms] they can be.

Mount the ground lead of the power supply to the bracket. This
gives you common point ground so everything at the radio is at
the same potential.

If you haven't already done so, relocate the antenna and the
radio away from those noisy spots mentioned.

Hope this helps...

I am selling the following for a friend:

I. Motorola Radios 32 channel 45 watt mobile VHF radio with Maxrad 3db gain antenna and deck mount. Includes mic and power cord.
Rig in good condition electrically, fair cosmetically.
asking $300 or best offer

II. Robyn 40 channel base CB with sideband and "extra" channels. Includes amplified desk mic.
Rig in mint condition with original carton and literature.
asking $75 or best offer

III. Maxrad tri-band mobile antenna (VHF, UHF, 800 MHz)
asking $30

IV. Maxrad base antenna with radials, VHF
asking $35

V. Two VHF maxrad mobile antennas
asking $30 for pair, will seperate for $20 a piece

VI. Antenna Specialists quarter wave mobile antenna
asking $10

VIII. 50' RG-8 coax w/o connectors
asking $20 for roll

For further product inquiry or to purchase an item, please email chip448@yahoo.com

***WILL ACCEPT BEST OFFER ON ALL ITEMS, AS ALL ITEMS MUST BE SOLD!

Source record: 31352

You dont run the Heliax all the way to the antenna connection.
What you do is end the hardline near the antenna (and near the
radio) then make 9' jumpers using smaller 1/2" hardline or 9913
coax that will connect the hardline to the equipment/antenna.

ANDREW Cable makes 7/8" Heliax to SO-239 connectors. Then use PL-
259's on the jumpers (if using 9913)

Stay away from the 9913. It is prone to moisture infiltration and internal arcing. The breakover voltage is less than 1kv(600 i think). A value easy to get with a little power and a high SWR.

1904. CME [Coronal Mass Ejection]

Greetings!

It's been quiet on the radio all day...

I took a trip to the www.spaceweather.com site and found out why...

A Coronal Mass Ejection occured on April 14, and it looks like the
Earths Ionosphere is taking the brunt of the slower charged particles
arriving and passing by Earths orbit today.

Might have a vivid Aurora tonight for northern lattitudes - similar to
what happened on April 7th. A similar eruption occured on April 5 to
cause that.

Nice to see the Solar Heilospheric Observatory [SOHO] is back up and
running.

Hey...It was a slow news day!

Regards!

Great now another worry!!! That thought crossed my mind then went right out
the door for some reason!!! :/ Anyway to protect the onboard 'puter...shesss
did not have to worry about this stuff when I was doing it over 20 yrs ago.
All we worried about was not draining down the alt./battery during transmit
so we still had lights!!!!

Also never mind about the wood for mounting. Thought it over and came up with
a much better way. Using metal rack that I built. Looks like it will work
pretty slick, plus I can ground it to the frame alot better than the other
way!!

One last thing. I told ya all that I was not awake. I have NO idea where the
number 12 came from. If any number was to be given it should have been 4"
muffin fans....shesssss long days short nights catching up this this old
fella!!!

Thanks

John,
Good idea! Here are some hints etc.
1. The 'female' Pl-259 is called an SO-239
2. About the electrolytic cap. recommend a 50V rating.
3. The 'motor-wire' is usually called "magnet-wire"
4. A substitute for the ferrite bar is a torroid core
of the correct mixture and size.(bigger is better)
5. A shielded 2-conductor cable might be better than
using coax.("simpl'er", not hard to make, less possible
confusion with connectors)

When you going to start manufacturing these things? I'll
help distribute them.
'Doc

> output installed on the radio.
> Any suggestions would be appreciated.

Your radio has a peak to carrier ratio of 25:1.
A peak to carrier ratio of more than 6:1 is
counterproductive. So, have a tech set the
peak to carrier ratio on your new system (radio
and amp) for 6:1. That means if the maximum
peak power using the amp is 1000 watts, the
carrier power should be about 165.

I agree. Only a fool would use RS RG8x in an elevator shaft for this, or any other leaky feeder application. Most importantly because it would not meet the building codes which almost always call for CATV-R for elevator shafts (CATV-P for ducts). These cables are purposely built so as not to emit poisonous gases when they are burnt. Conversely, they are more lossy and typically have no UV protection so don't bother using them up your tower. There are many types of leaky coaxes available, including the Times Microwave series.

The RF level is "inconsequential" except for those standing around the vehicle, or riding in the back of a pickup truck, or riding in the back seat of a car with a trunk mounted antenna, or those otherwise being immediately subjected to the RF from the antenna.

However, in the 27 MHz frequency range, there is little real concern for those around the vehicle unless the exposure is truly extended (or the RF ourput is unusually high).

By the way, I think you meant to put a comma after the word, "mobile." ;-)

Wire it directly to the battery. This will take all of the electrical accessories in your car out of the same supply circuit as the radio. Also, believe it or not, the quality of the connections to your battery can and will have an effect on the amount of noise through the radio's speaker. A fella at a two way shop had a similar problem with a commercial radio. I suggested cleaning the battery terminals first. He didn't believe me. Took the car (a taxicab) to an auto electric shop. They fixed the problem and charged him $50. Guess what? They cleaned the battery terminals.

Boy, Hambo, I is im-pressed! You should of just told him to QUIT watching the 52-890 mc TRASH BAND (worse than CB or 2 meter CB could ever be) ! Dave!!!!!!!!

David Little wrote in message <8d94volnb1@slb7.atl.mindspring.net>...
> Wrong. If the Ham is operating a legal station, then he/she is under no
> obligation to try helping the neighbor fix the defective consumer
> electronics.

This is correct, and is stated on the paperwork that comes with any receiving device sold today. It specifically states the owner of the device must accept any signal received by the device. With the constant scaling back on the quality of manufacturing practice to save a few pennies on each set produced, it is impossible to eliminate the possibility of RFI.

A case for consideration.... I was very active in 2 meter SSB weak signal work, and used a 300 watt tube amp made by Command Electronics. The amp was very clean, and as good a model as was available to the amateur market. Living in a fringe area, many of the neighbors had preamps installed on their TV antenna systems (Satellite was not yet affordable by the masses). The Television spectrum covers from 50 MHz to near 1 GHz, and nearly all points in between, with the audio and video signal of each channel on different frequencies. To boost signals in the TV spectrum, a preamp must be able to amplify any signal between 50 MHz and 1 GHz, and without any discrimination against the frequencies in this range that don't host a TV signal. The preamp manufacturers are equally concerned with maximizing profit, and produce a ultra wideband preamp enclosed in a plastic shell. It can amplify signals received by the antenna or the circuit board equally as well. At this point is starts to become clear that any RF signal between 50 and 1000 MHz will interfere with TV reception, if it is of higher signal strength than the received station. Remember, all energy (with the exception of DC) has frequency. Can you guess what happens when a humming bird flies in the general area of the antenna/preamp "RF Vacumn system"? How about a car going down the road with one bad spark plug wire, or a neighbors blow dryer with a set of brushes on their last leg ?

One of my neighbors has just purchased a new TV, and had a respectable antenna system. He complained about interference, and his complaint times coincided with the entries in my log book, so I went to work. I first contacted the ARRL, and got the info in writing behind the ruling that the set must accept any signal it receives, thus negating legal intervention or FCC involvernent in RFI cases. Armed with this documentation, I met with my neighbor and made many attempts from tuned stub filters to even footing the billl for commercial band stop.bandpass filters. They had no effect. I took my small IC2SAT HT to his house, and found I could blank the TV with 2

watts, 1 watt and 100.mW. I then explained what a dummy load was and it's use in testing gear to prevent stray RF and interference. I proceeded to install a Commercial dummy load made by a company that he recognized the name and accepted that it should do the job. At 100 mW, with the dummy load substituted, the HT still shut down the Brand New TV set. Since it was a recent purchase, I asked him if I could see the paperwork that came with it, which he produced. I showed him in writing the manufactures required disclaimer stating the consumer must accept any signal received by the set, and he began to see the light. I wasn't particullarily thrilled that it had come to that, and he made comment that he wanted to be able to enjoy his new $400.00 TV. I then invited him down to see my $3500.00 Amateur Triband all-mode satellite rig with automated and computer operated antennas, azmuth and elevation rotors and even down to the invoices for the price of the coax per foot as compared to his investment. At this point, the road forks to either a rational understanding that I had made the attempt, spent extra time and money when not required to, and that the TV set was far inferior in quality to the Ham rig, as specifically stated by the manufacturer. The other fork in the road was to pursue a course of irrational behavior that had no support from the legal system or the FCC.
I thern showed him my C band satellite TVRO outfit, and he saw that the quality of the piccture was better than anything he had seen in the last 10 years on any set in the area; even when I was operating in the next room. He asked for assistance in picking out a satellite rig, I helped him with that, helped pick out the site for the dish, provided him with contacts for programming and installation, and ended up with a goof friend out of the deal.

It doesn't always go like this., In fact it probably seldom happens this way. However, the situation is clearly outlined and the ground rules are clearly stated. RFI can be caused by many things when such a large spectrum is being utilized. It has finally been realized that the manufacturing industry will continue to produce products as cheaply as possible, and that the trade off is spectral integrity in the front end. With this type of equipment unleashed on the market it is virtually impossible to remove the chance of TVI problems arising.

No where in the documentation does it single out licensed, unlicensed, human or animal sources as responsible parties.

> In practice, it is wise to try to work things out with the neighbor, such
> as suggesting fixes for the problem - or agreeing to not operate during
> certain hours of the week.

This is the "right" thing to do, but it must include the understanding of the neighbor that you are acting on your own free will, and not due to any required action, either legal or implied. It all becomes a matter of calmly and politely laying the cards on the table first; explaining first that you are not required to correct their problems, and the mere purchase and setup of the equipment indicated that by the terms set out by the manufactirer that they were agreeing to accept any interference, as stated by the paperwork that came with the TV. Just because they didn't read, or didn't

understand the disclaimer doesn't make you obligated in any way to correct their problems.,. After you get that out of the way, they will either become cooperative or hostile., If you stand your ground, and still make a sincere offer to help, there is no basis for them to have any compalint against you.

There may be many opinions and interpretations of what the "law" is on TVI. I proceeded only after learning the facts, and came out with very few scratches and no casualties. If I had gone into this situation un-prepared, I could have just as easily forced myself off the air by claiming responsibility out of sheer ignorance or lack of understanding what I was working with.

Points to Ponder,

David
KD4NUE

Yur Hambo station would come over a Satelite system? Is this possible? What an arrogant installer! I guess receivers of communist propaganda on 52-890mc have priority to have unhindered reception of their filth! Dave!!!!

Jerry Oxendine wrote in message <38F8ED6C.1D64@bellsouth.net>...
I had a similar situation some years ago. Most people don't understand the mechanics of RF, of course, and they automatically think that it is the fault of YOUR radio set. I was politely informed by a neighbor that I was blanking out his TV and asked what could be done to fix it. I sprang for a couple of filters, installed them, and it mostly cured the trouble. I also explained the fact that TV and stereos are not made these days with proper filtering/RFI rejection. I, too, showed him my ham station with which he was impressed (not that it was so special, but he was interested in such things anyway being a tinkerer). By limiting my operation to late night mostly, I haven't had any complaints.....
except for the satellite installer that saw my antenna and beligerently told me I would have to stop using my radio because "I" was interfering with his customer across the street. He was disappointed when he dis-covered that at the times the interference occurred, I was 25 miles away at work! LOL!

Just about any antenna will work for you at that distance.

No need to get real fancy or spend a bunch of money on an antenna for 2-5 miles especially over pretty much flat fields.

Lots of farmers are doing that.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=310361574

Midland 77-285A 40 (+ 200) Channel CB

This is a superb, small CB. Instant channel 9 and 19 buttons, 4 memory channels, and other goodies. Has no scratches and has been well taken care of. Comes with original mic, box, owner's manual, and accessories. Complete information can be found at the Midland Webpage. When I bought it at one of the local CB shops here, it dead keyed 5W and swung up to 16W. Covers frequencies listed below.

Band A: 25.615 MHz to 26.055 MHz
Band B: 26.065 MHz to 26.505 MHz
Band C: 26.515 MHz to 26.955 MHz
Band D: 26.965 MHz to 27.405 MHz <- Standard CB Band
Band E: 27.415 MHz to 27.855 MHz
Band F: 27.865 MHz to 28.305 MHz

Winning bidder pays $10 and chooses shipping via either UPS or U.S. Postal Service. I would keep this CB for my own use, but I use a Cobra 19 Plus for all of my CB needs now.

1937. Re: What is the best Coax on the market today?

Source record: 31387

Misleading eh? OK, lets look at my comments alittle closer.

Whats so misleading about comparing Beldon 9913's 1.3dB loss to
ANDREW 7/8" LDF/5's .19dB loss over 100 feet at 30Mhz?

Lets do some math:
1.3/.19 = 6.8, hence the 1st cable has 6.8 times more
attenuation than the second cable. This looks like 5th grade
math to me. What would happen if a 500' run were needed? The
1.3dB loss of 9913 per 100' would be exponentially increasing as
the cable length increases. Cable attenuation could result in as
much as a 60% loss, which means that if 10 watts is leaving the
radio, 4 watts is making it to the antenna feed point. Keep in
mind that this scenario is at 30Mhz. At higher frequencies,
efficiency drops right off of the charts.

TVI- Have you ever tried correcting a TVI problem by going from
95% shielded coax to hardline? The majority of people Ive known
(including myself) have drastically reduced TVI by upgrading to
better cable. More shielding = Less stray RF. This is hardly
misleading.

Price - No one said anyone has to pay full price for hardline.
Our local cable company gives used 100'+ runs of hardline away
just so they dont have to get rid of it. In addition, the
original poster asked for recommendations about the *Best
cable*, not the *Best cable for the money*

I think you are talking about "Plenum Approved" cable; cable that is approved for overhead use when the overhead space acts as a return for the ventilation system.

The RS cable was chosen because of it's leakage, and the result is much like the Passive radiator type of antenna systems used to increase cellular handheld range while using in a car.

Scott,

I am really going way back in the now failing data banks. I think they are Plate Tune, Load, S-meter adjust, modulation and ?. I last used one of these in 1973. It is still a great rig, and a nice example of technology.

Gene,
The best length to make jumpers is what ever length
will reach from one place to the next, with enough extra
length to make moving the radio/amp/meter enough to
disconnect it. If 3 feet seems long enough, it probably
is.

Pontiac787,
No. <-- short answer.
The longer answer is that there is no simple, and
consistent method of determining range or mile/watt.
Besides changes in propagation, there are other variables
that make trying to predict miles/watt impossible. Or,
at the very least, too complicated to do.

Compaq,
Nope! You don't have to buy/use a Radio Shack antenna,
any of them will do fine. You will have to tune the antenna
just like you would the one from Radio Shack.
Also, theres no real need for the RG-8 coax. RG-58 should
work fine also. (assuming you don't run more than the 'normal'
power...make that 'legal' power.)

Hello David: Use to have a good friend of my Dads, who use to have one of these old Regency DSB/AM radios. Ray a "Super CB'er" (Handle Buckshot) would record SSB transmissions while on the AM mode. So the recordings sounded like typical Donald Duck sounding SSB transmissions while in the AM mode. He would then play these recordings back while in DSB mode. Ray would say let em try to that one in, Yeah!

Ray being out of work and a real character, I figured I fixed the radio for free. I enjoyed the entertainment and antics Ray did on the air.

Ray says to me "Jay I'll pay ya when the Ol Lady gets a job, and I pay off the 58 Old's". This was 1972! I was repaid many times over, just listing to all the how-raw and antics. All the CB'ers on CH 15 in the San Fernando Valley and all the truckers on the Grape Vine will never be the same.

SSB is something that I would take over any fancy dodads..Alot of times I have noticed that when you can do get out on AM SSB pulls through. Of course it does take some getting used to. But if opinions count I vote for a SSB rig!

All your credentials and you still think you can multiply
100watts CW by 1.414 to get the PEP? (from a former post)

I just had to say that ..... :)

I know this looks like a major flame but in reality it's a little
bit of constructive criticism. Flashing your badge around
doesn't really get it in this newsgroup. Modesty will get
you much farther.

I have had great results with the Wilson 1000. Based on that I would bet
that the fiberglass is helical wound top loaded and will outperform the base
loaded antenna. The ideal antenna is 102 inches long. If you start to
shorten the antenna you must create an artificial 102 inch by loading it. In
short, top load is best, center load is next and base load is the worst.

The Blue Face (Cobra/Magnum/Palomar/Galaxy) amps are
amongst the cleanest available. If any system will
work without causing computer problems, it's the one
you've selected.

What I often do with customers is set a system up
using jumper cables from the vehicle battery to
run the amp. Then, the instability of the system
can be guaged before the customer buys the amp.
You may want to do that before you do anything
else. That way, if the amp causes problems you
can return it and the dealer you bought it from
can still sell it as a new unit. If he can sell
it as a new unit, he should be able to give you
a full refund.

100Mhz! What spec sheets are you reading? Your numbers are as anonymous as your email address Mr. Bobcat. Why dont you download this .pdf file (containing LDF5 HELIAX specs) from the ANDREW cable company. Then go to page 127 of the AES Spring/Summer 2000 catalog and look up the attenuation of Belden 9913. Then get back to the group once you've read them both.

http://www.andrew.com/products/basestation/heliax/50grp.asp

As far as 1.1db goes, when is the last time you compared the wattage out (at your radio) vs. the wattage out (at the antenna feed point)...or are you one of those guys that says there is no difference in conductor size?.....get real.

you are an idiot if you intend to hook a wire up to the tower itself and attempt to broadcast on it... might as well hook it up to the railroad tracks down the road, they are much longer...

not odd, the noise is coming from the alt. and coming in on
the 12 volt lead. thats why the whining noise....sparkplugs
will sound like a motorboat.... reroute the 12 volt lead ...go
to the battery and be careful not route them close to any wires
coming off the alt.

Is there any way to determine how far one can broadcast depending on how
much
power they run. For exp. if a set up will transimit 15 miles on 4 watt can
it
be determined how far it will go on 200. I realize that conditions and
set-up
will tremendoulsy affect the out come but I am looking for approx. distances
for direct comunicatin (obviously not skip) in near perfect conditions.

Just curious

1970. What is the best Coax on the market today?

Ok, I will check out the link you posted as soon as you post a URL that's correct.. Now you answer my
original questions. Remember 3 dB is a change of 2. You still think that a 1.11 dB change is 6 times?
Guess its not just simple 5th grade math is it ? You can't take 1 dB level divide it by another and get
a valid answer. You think you can tell the difference when you add an additional 1 dB off loss? You
can't tell the difference. And quit trying to put words in my mouth with the conductor size thing. If I
had a 100 watt transmitter fed through coax witha 1.11 dB loss what would I see at the antenna? Now
you get real and answer my questions if you can? If you don't know the answer, say so

Try spraying some teflon on your coax Wildcat, that will make your 5th grade math work

Get a Ranger RCI 2950...or President Lincoln. These are 10 meter radios that can be re-enabled to operate on 11 meters. They are all mode, AM, FM, USB & LSB as well as CW (morse code). Each has 10 watts on AM & FM and 25 watts on SSB running maximum power. Power is varible...and the units can scan channels as well.

1976. Re: Haven't used a CB in 10 years..

Long antennas tend to end-fire so theory says you should have one hell of a signal straight up. Do it anyway and report back.

>Remember 3 dB is a change of 2. You still think that a 1.11 dB change is 6 >times?

You are trying to convert attenuation numbers into power multiplication numbers which is impossible. If you go back and re-read my post, I compared a cable with an attenuation of 1.3 dB per 100' to a cable with an attenuation of .196 dB per hundred feet. One cable has 6 times greater attenuation than the other.....hello.....What is so difficult about interpreting this?

>Guess its not just simple 5th grade math is it ?

Apparently it isnt because you're defininately not getting it?

>You think you can tell the difference when you add an additional 1 dB off loss? >You can't tell the difference. And quit trying to put words in my mouth with the >conductor size thing.

This is where your niavety is really shining through. Lets say you have the opportunity to get some free cable. It can be either 9913/RG213 or 7/8" Heliax. Based upon the cable specs of each you determine that the only difference between the Coax and the Heliax is a mere 1.1 dB. Because you are going to use this cable on 28Mhz, you've determined that this amount is insignificant so you eventually choose the 9913. This is where you blew it. Here are some of the reasons why:

1. Matched Line Loss - Because you are not interested in the conductor diameter (which you've already stated), the matched line loss of your 9913 could easily result in an additional 5-6 dB loss at the antenna feed point. Smaller diameter cables result in higher matched line loss which means you could very well have a disguised SWR of 1:2 to 1 at the radio, yet at the antenna feed point the SWR can be very realistically 5:1 or more. Many Hams and CBers who have been around a long time know this fact very well. Conservatively, if we add the matched line loss of 5 dB to the original 1.1 dB attenuation of the cable, the total loss could be easily 6.1 dB. Is a 6.1 dB loss worth getting better cable? These are very conservative "real world" numbers. Couple this with amplification. What do amplifiers do to SWR? If you put a 1 KW amp in line with this setup you could very easily have losses exceeding 12 dB. All of a sudden the mere 1.1 dB cable attenuation could very easily result in a 12 dB or more loss. This is the problem when people just read

factory spec's. They dont take into account any other variables. THE LARGER THE CABLE THE MORE ACCURATE THE SWR (not to mention the larger cables ability to act as a greater impedence transformer)

Mr. Anonymous, if you want the sines, cosines, and resulting formulas for all of these cables please post a REAL email address and Ill be happy to sent them to you......I dont feel like posting the same formulas that are in about 1000 different Ham books.

2. Resonation - In the above example the transmitter could conservatively lose 6.1 dB while transmitting. What about receive attenuation? Is your receiver sensitive enough to forego losing an additional 6.1 dB of input signal? The Law of Reciprocity states that what you lose in transmit, you also lose in receive. If you cant hear them, you cant talk to them.

3. TVI/RFI - This ones a no-brainer (even for you). More shielding means more energy is going out of the antenna. How much does 1.1 dB (in heat and RF) equal in relative field for TVI purposes? Probably not very much if your only putting out 4 watts, however what about if you are putting out 1.5KW.

>If I had a 100 watt transmitter fed through coax witha 1.11 dB loss what would I >see at the antenna? Now you get real and answer my questions if you can? If you >don't know the answer, say so

Whats you match line ratio? Whats your cable reactance? You could lose as much as 80% of you total output power (and this is at 28 Mhz).

>Try spraying some teflon on your coax Wildcat, that will make your 5th grade >math work

Teflon... am I reading the wrong posts or did I miss a crucial posting here? Anyway Im done with this post...feel free to add whatever you like, but more importantly dont base your opinions on factory spec's..... Oh yeah, my 67 Cuda really did have 420 hp right from the dealer.....

You couldn't give money to give up my Delta force for a galaxy. My delta force (40 watts right out of the box) will blow a Galaxy 99 (I have owned 3 of them) right out of the water if you ask me. That is my opinion. That and I think galaxys sound kinda crapy.

Did you ever take a close look at those Mexican parts used in the construction of your American made Buell ???????????? The same Mexican parts used in the American Harley Davidson !!!!!!!!!! I did and sold my Dresser. Made $2000.00 dollars on the deal and laughed all the way to the bank. As far as American made goes I think you should say "American assembled".
I have ridden a Buell at Nelson`s Ledges(racetrack) in Ohio, and it seemed to run very well. It has a distinct sound !!!!

>is?

Well any way. Thanks to everyone who responded. I think I have enough info to chew on for a few days. I don't think I'll go hard wire. It would be over kill for me.
I noticed a few dealers responded. It you like, email me with your best quote on 100 foot total of your recomended "non hard wire" coax. It might be a good idea to offer a 2nd choice to. Also if you sell it I'll need 100 foot 8 wire rotor wire for a Ham IV.
Thanks
Ben

1991. FS: National NCL-2000 Linear Amplifier 2000 Watt Amp

Newsgroup: rec.radio.cb
Date: 2000-04-17 00:00:00 UTC
From: cbatterman@attglobal.net
Message-ID: <38FB30E6.DB9A75F9@attglobal.net>
Source record: 31456

This National NCL-2000 linear works flawlessly. It was rated for
2000 Watt input on 80 -10 meters. I measure 1500 watts DC output with
my Bird wattmeter. Comes
with a spare set of 8122 tubes and original manual.

The amp is in nice condition. Front panel is near mint with only
some wear on the rocker switch lettering. Cabinet has a rub on the left
rear and a few small scratches on the
trim ring. Everything appears original inside and out including
the paint.

This is my favorite classic amplifier. (and I've owned a lot over
the last 30 years) You can drive it with anything from 20 - 200 watts,
solid state or tube. Tons of gain.
Works like new.

Thanks !
Chuck
(831) 688-0785

From: "Scott (Unit 69)" <upplus@-NOSPAM-hotmail.com>
Message-ID: <38FB3530.53601D71@-NOSPAM-hotmail.com>
Source record: 31458

Depending on the radio final tuning and the amplifier input tuning,
you may have to play with jumper length to get a good sound. Some
boxes like 10 feet, others like 5 feet of jumper. Experiment until
it sounds right. Also, too much drive sounds like sh!t.

Its misleading in that your numbers are attempting to show that using ANDREW 7/8 that the signal
would be 6 time greater than with 9913. Which is not the case, 1.11 dB change wouldn't even be
noticed.
nice try Wildcat

Although coax is a capacitor, it does not make that much of a difference on
what length. Use the length it takes to get there, nothing more.

Well, I couldn't;t stand it. The fond memories forced me to jump over to eBay and pick one up; with a Sams fotofact. I have one of those 4 tube "modulators" that likes swinging through the trees, and this rig will give the wattmeter needle hell when used with that amp.

I am trying to decide between 2 different galaxy radios, the DX 66V and the DX 77HML. The DX 66V looks alot nicer, (bigger meter frequency counter) but, the 77 has SSB capability and I was wondering if having that was worth not having all the nice meters. I have never used SSB and I would like it if some one would give me some advice on which way radio I should buy. The difference at www.coaxkid.com is only $10 so price is really not an issue here I just want to know which y'all think I would get the most good/fun out of.

Kinda pricey on the Heath,I don't like the lack of 160,30,17,12 meters
but they still will work on those bands.
I don't like the little fingers on the bandswitches that corrode and
burn.
Don't like the relay.
Don't like the "'54 international pickup" type styling.
Don't like tubes,period!

If interested I have an SB201 with 2 572Bs for $250.Of course it puts
out about 1/2 an "S" unit less than the 220.

As the input impedance of a lot of amps are not 50-ohms and the output of most trannsceivers is 50 sometimes playing with the jumper length can make a difference. If there is a mismatch though the jumper should be something besides 50 ohm cable. You cant match 50 ohms to some other value with a 50 ohm linear transformer(read as jumper). The best thing is to not worry about the length and install a small coax to coax antenna tuner between amp and radio and tune for best output. These cost between $10 and $20 at your local flea market CB booth.

Why don't you explain it for us? How much loss is 1.11 dB?
you actually think the difference between 1.3 dB of attenuation and .19 dB of attenuation is 6 times?
How much loss is noticable? 1.11 dB? 3.0 dB? Come on, put up or shut up? Apperently MERIT radio
group doesn't understand attenuation. Plus the values you quoted were for 100 Mhz not 30 Mhz

Try again wildcat, get it right this time

Craig,
1000 watts... not on it's best day! Typically about
600 watts. Depends on tubes, construction of the amplifier,
antenna etc. Make the sell'er a deal, you pay him $1.00 for
every watt CW output over 600 watts. He pays you $1.00 for
every CW watt output UNDER 1000 watts.

Sure hope this starts a thread on this subject because I am at
the same point you are at. Confused as to which one to buy. I
use a 4' Firestick now and it gets out great...have DXed Canada
and many states from here in Texas with it. It was only 12
dollars at my local ham shop and is better than some $40-50
models I have blown money on.

(I notice the CB shops sell it for $18 and the ham shops sell it
for $12. Wonder why?)

From: CodysPC@Iserve.Net
Message-ID: <38fb8616.639276@news.iserv.net>
Source record: 31498

Greetings!

Well, the two spots you mention are more than likely the two culprits.

With the on-glass antenna, was a ground braid supplied to ground the box that sticks onto the inside glass? It's a short jumper and if you did get one, I recommend that a small hole to be drilled to mount the braided strap directly to metal of the window frame that on the vehicle body.

Why? Because of noise reduction. Having a floating ground plane like that antenna tends to increase the noise level because there is no ground reference.

If you didn't get one, [strap] not all is lost. I recommend that you take a moment or two to mount the radio [via the bracket] to something that has metal and is away from the dash. At least you'd have a ground that is better than no ground at all.

The radios power supply to the cigarette light plug is not bad, but if you are suffering from noise - well, you need to take the suggestions listed earlier.

Remember the little trick about measuring resistance from case of the radio to the ground lead of the power supply cord? If it shows a dead short, mount the radio via that bracket and don't use the negative [black] wire - in fact, trim it off if you can. You then can get rid of close to 1 - 4 S-units of signal noise if you let the radios own ground at the bracket take care of itself.

If you can't due to constraints, then the antenna will have to have some type of ground for it.

If that NGA antenna did not come with a ground braid to help mount it and improve reception - get rid of it and try one that has this strap and use the strap to body ground, you will improve the performance.

Source record: 31520

Their is a formula that is probably only applicable to antenna ranges that tells you what the field strength should be at a certain distance fromthe antenna. If I remember field strength diminishes in proportion to the distance squared. It does not take into account things like the curvature of the earth and is only applicabletoline of sight communication.

it makes absolutely no difference, what length jumpers you use, this is
nothing more than a perpetuation of cb radio misstatements and
falsehoods. if you don't believe me , ask dr handy andy,....cd is
out.....

Lets see,Hams can only build and sell one amp a year and can't buy commercial amps that will work on 10m without a mod. Wonder how this happened, could not have had anything to do with CB.

well do you know these people because everytime i look somewhere
someone is complaining about the lack of communication and amount of
time it takes for them to complete and order, cd is out.....

that is why when you are working with hardline , you need to go to the
home depot or whatever and get a electrician's greenlee pipe bender,
works wonders on hardline,.....cd is out.........

go with hardline. you can pick it up used at a very reduced price at
these companies that specialize in tower building and whatnot,
sometimes they even give it away if you catch them at the right time,
but those damn connectors . the last time i bought some about two years
ago, they were about $60.00 a piece for 7/8 hardline with a pl259 on
it,.....cd is out.....

Me too - Got my first CB in 1966 at the ripe age of twelve. My dad owned the lisense and I happened to have a pretty deep voice for my age. Nobody ever suspected that I was so young. We all used call signs and channel 11 was the call channel in our neck of the woods (N. California).

I had a homemade antenna made up of a long shortwave antenna wire that I strung across the roof of our house attached to two metal poles I found discarded in the lot next to ours. It looked like that silliest thing you ever saw but by golly I could get out with it. I had an old Knight (Allied) base station that I got at a flea market for $10. I could recieve all 23 but noly had crystals for six channels.

Skip was a relatively rare occurance then, maybe two or three times a month. Over the next few years it started coming in more and more to where by 1969 it was everyday and strong. My first skip contact was with an operator in Alaska that was a member of the "Radio Alaska" club and went by the handle Southern Boy out of Juneau.

I have been in and out of CB ever since. Today I am getting back in, but don't have the financial resources to get all the power that CBers run today. Hey my priorities have changed a bit.

"Double Eighty Seven on the beach in Southern California, riding this surfboard mobile and drinkin tequila and I'm rockin out"

2062. Question About Galaxy Radios.

Newsgroup: rec.radio.cb
Date: 2000-04-17 00:00:00 UTC
From: Miles Davis <MDD327@aol.com>
Message-ID: <8degfn$v6$1@nnrp03.primenet.com>
Source record: 31527

I have some friends that consistently stop me from buying a Galaxy Radio. I hear, "They have bad solders..." or "....They are good for base stations only". They are Mirage 88 guys. As I understand it Mirage, Galaxy and a few other radios are made on the same assembly line but imported under different names. If I'm wrong someone please let me know. Here are the questions I have:

1 Are there any areas on the board that are high risk or tend to have weaker solder joints?
2 How good is the foil on these boards?
3 Should I just heat up the tracers and joints on the whole board?

Any ideas would be great.

--
Miles Davis
This is CB radio.....No crying allowed!

2063. Re: Question About Galaxy Radios.

Miles,
First, don't 'heat up' the traces or solder joins in a new
radio. Before 'fixing' a radio, be sure it has a problem!
If a manufaturer has problems with a radio they make, that radio
will either 'disapear' and a new design comes out, or they fix
the problem.
If you ask 5 people which is the 'best' radio, you will get
at least 5 different answers. If you 'like' a particular model,
and you haven't heard a bunch of complaints(that can be proved),
go ahead and try it.
'Doc
